Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST MSFT ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Microsoft Corporation's common stock (NASDAQ: MSFT) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be 2 times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of that Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or that the Fund will pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to reference the following products as Underlying Leveraged ETF:

(1) Direxion Daily MSFT Bull 2X Shares (NASDAQ: MSFU). Investors can access information about MSFU, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-150525 and 811-22201. This information, derived from MSFU's filings with the SEC, is essential for investors to understand MSFU's operations, investment strategy, and financial prospects. The description of MSFU's principal investment strategies as outlined here is directly sourced from its prospectus.
(2) REX 2X Long Microsoft Daily Target ETF (CBOE: MSFX). Investors can access information about MSFX, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-23444 and 811-23439. This information, derived from MSFX's filings with the SEC, is essential for investors to understand MSFX's operations, investment strategy, and financial prospects. The description of MSFX's principal investment strategies as outlined here is directly sourced from its prospectus.
(3) GraniteShares 2x Long MSFT Daily ETF (NASDAQ: MSFL). Investors can access information about MSFL, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-214796 and 811-2314. This information, derived from MSFL's filings with the SEC, is essential for investors to understand MSFL's operations, investment strategy, and financial prospects. The description of MSFL's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the software and information technology industry.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH MSFU AND MSFX, THEIR TRUSTS, AND THEIR SERVICE PROVIDERS.

THE FUND, TRUST AND ADVISER ARE AFFILIATED WITH MSFL.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Industry Concentration Risk — The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the software and information technology industry. The value of stocks of information technology companies and companies that rely heavily on technology is particularly vulnerable to rapid changes in technology product cycles, rapid product obsolescence, government regulation, and competition, both domestically and internationally, including competition from competitors with lower production costs. In addition, many information technology companies have limited product lines, markets, financial resources or personnel. The prices of information technology companies and companies that rely heavily on technology, especially those of smaller, less-seasoned companies, tend to be more volatile and less liquid than the overall market. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the information technology industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. that generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given month. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so. U.S. trade disputes or other disputes with specific countries that could result in additional tariffs, trade barriers and/or investment restrictions in certain securities in those countries.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST MSTR ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Strategy Inc.'s common stock (NASDAQ: MSTR) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [1]	2.09%
Acquired Fund Fees and Expenses [2]	0.03%
Total Annual Fund Operating Expenses	3.11%
Fee Waiver/Reimbursements/Fees Paid Indirectly [3], [4]	-1.93%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements/Fees Paid Indirectly [1], [2], [3], [4]	1.18%

(1) Other Expenses are based on actual amounts incurred during the Fund's fiscal period ended June 30, 2026.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's fiscal year ending June 30, 2027.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.
(4) The Funds' have a fee arrangement with its custodian which provides for custody fees to be reduced by Create/Redeem credits received by the custodian from Authorized Participants.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years	5 Years	10 Years
$ 120	$ 778	$ 1,461	$ 3,285

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it, directly or indirectly through a subsidiary, buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in annual fund operating expenses or in the Example, affect the Fund's performance. During the most recent fiscal year, the Fund's portfolio turnover rate was 0% of the average value of its portfolio, since the Fund invested only in instruments that are excluded from portfolio turnover rate calculations. However, if the Fund's use of derivatives were reflected, the Fund's portfolio turnover rate would be higher.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) T-REX 2X Long MSTR Daily Target ETF (Cboe BZX Exchange: MSTU). Investors can access information about MSTU, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-234544 and 811-23439. This information, derived from MSTU's filings with the SEC, is essential for investors to understand MSTU's operations, investment strategy, and financial prospects. The description of MSTU's principal investment strategies as outlined here is directly sourced from its prospectus.
(2) Defiance Daily Target 2X Long MSTR ETF (NASDAQ: MSTX). Investors can access information about MSTX, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-264478 and 811-23793. This information, derived from MSTX's filings with the SEC, is essential for investors to understand MSTX's operations, investment strategy, and financial prospects. The description of MSTX's principal investment strategies as outlined here is directly sourced from its prospectus.
(3) GraniteShares 2x Long MSTR Daily ETF (NASDAQ: MSTP). Investors can access information about MSTP, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-214796 and 811-2314. This information, derived from MSTP's filings with the SEC, is essential for investors to understand MSTP's operations, investment strategy, and financial prospects. The description of MSTP's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the computer and information technology industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. MSTP is affiliated with the Fund and both funds are issued under GraniteShares ETF Trust. The Trust and the Adviser have been directly involved in the preparation of the disclosure of MSTP's publicly available documents. In connection to MSTU and MSTX, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding MSTU and MSTX is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of MSTU and MSTX.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH MSTU AND MSTX, THEIR TRUSTS, AND THEIR SERVICE PROVIDERS.

THE FUND, TRUST AND ADVISER ARE AFFILIATED WITH MSTP.

Additional Information on Bitcoin

Bitcoin is a digital asset that is created and transmitted through the operations of the online, peer-to-peer Bitcoin network, a decentralized network of computers that operates on cryptographic protocols. The ownership of bitcoin is determined by participants in the Bitcoin network. The Bitcoin network connects computers that run publicly accessible, or "open source," software that follows the rules and procedures governing the Bitcoin network. This is commonly referred to as the Bitcoin Protocol. Bitcoin, the asset, plays a key role in the operation of the Bitcoin network, as the computers (or "miners") that process transactions on the network and maintain the network's security are compensated through the issuance of new bitcoin and through transaction fees paid by users in bitcoin.

No single entity owns or operates the Bitcoin network. Bitcoin is not issued by any government, by banks or similar organizations. The infrastructure of the Bitcoin network is collectively maintained by a decentralized user base. The Bitcoin network is accessed through software, and software governs the creation, movement, and ownership of "bitcoin," the unit of account on the Bitcoin network ledger. The value of bitcoin is determined, in part, by the supply of, and demand for, bitcoin in the global markets for trading bitcoin, market expectations for the adoption of bitcoin as a decentralized store of value, the number of merchants and/or institutions that accept bitcoin as a form of payment and the volume of private end-user-to-end-user transactions.

Bitcoin transaction and ownership records are reflected on the "Bitcoin blockchain," which is a digital public record or ledger. Copies of this ledger are stored in a decentralized manner on the computers of each Bitcoin network node (a node is any user who maintains on their computer a full copy of all the bitcoin transaction records, the blockchain, as well as related software). Transaction data is permanently recorded in files called "blocks," which reflect transactions that have been recorded and authenticated by Bitcoin network participants. The Bitcoin network software source code includes protocols that govern the creation of new bitcoin and the cryptographic system that secures and verifies bitcoin transactions.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the software and information technology industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock performance may be affected by global markets and demand for its products and services, its ability to develop new products and services, inventory levels, supply chain issues, the performance of third-party software developers, system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the software and information technology industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Bitcoin Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to risks associated with bitcoin. Investing in bitcoin exposes to significant risks that are not typically present in other investments. These risks include the uncertainty surrounding new technology, limited evaluation due to bitcoin's short trading history, and the potential decline in adoption and value over the long term. The extreme volatility of bitcoin's price is also a risk factor. Regulatory uncertainties, such as potential government interventions and conflicting regulations across jurisdictions, can impact the demand for bitcoin and restrict its usage. Bitcoin is not presently widely accepted as a medium of exchange, which may be due to a number of common impediments and/or disadvantages to adopting the Bitcoin Network as a payment network, including the slowness of transaction processing and finality, variability of transaction fees, and volatility of the price of bitcoin. Additionally, risks associated with the sale of newly mined bitcoin, bitcoin trading platforms, competition from alternative digital assets, mining operations, network modifications, and intellectual property claims pose further challenges to bitcoin-linked investments. The value of bitcoin has been, may continue to be, substantially dependent on speculation, such that trading and investing in these assets generally may not be based on fundamental analysis. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Bitcoin Halving. While bitcoin prices have historically increased around halving events (a process designed to control the overall supply and reduce the risk of inflation in bitcoin, which uses a proof-of-work consensus algorithm and results in the mining reward being cut in half) there is no guarantee that the price change will be favorable or would compensate for the reduction in mining rewards. If a corresponding and proportionate increase in the price of Bitcoin does not follow future halving events, the revenue the Underlying Stock earns from its bitcoin mining operations would see a decrease, which could have a material adverse effect on the Underlying Stock's results of operations and financial condition.

Hash Rate and Difficulty. As demand for bitcoin has increased, the global network hash rate (i.e., the aggregate amount of computing power devoted to supporting the bitcoin blockchain at a given time) has increased rapidly, and as greater adoption of bitcoin occurs, it is expected that demand for new bitcoin will likewise increase as more mining companies are drawn into the industry by this increased demand. Further, as a greater number of increasingly powerful miners have been deployed, the network difficulty for bitcoin has consequently also increased. A high difficulty means that more computing power will be required in order to solve a block and earn a new bitcoin reward, which, in turn, makes the bitcoin network more secure by limiting the possibility of one miner or mining pool gaining control of the network. Therefore, as new and existing miners deploy additional hash rate, the global network hash rate will continue to increase, meaning a miner's share of the global network hash rate (and therefore its chance of earning bitcoin rewards) will decline if it fails to deploy additional hash rate at pace with the industry. If an effort to grow the hash rate, results in the inability to complete planned expansions on schedule and within anticipated cost estimates, deployment of newly purchased miners may be delayed, which could affect its competitiveness and results of operation, which could have a material adverse effect on the Underlying Stock's financial condition and market price for its securities.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with limited operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: The Fund has not yet completed a full calendar year as of the date of this prospectus and therefore does not have a performance history for a full calendar year. Once available, the Fund's performance information will be accessible on the Fund's website at www.graniteshares.com and will provide some indication of the risks of investing in the Fund by showing changes in the Fund's performance and by showing how the Fund's returns compare with those of a broad measure of market performance. The Fund's past performance (before and after taxes) is not necessarily an indication of how the Fund will perform in the future.

Portfolio Managers: Jeff Klearman and Ryan Dofflemeyer have been portfolio managers of the Fund since the Fund's inception. Jeroen Visser has been portfolio manager of the Fund since September 2026.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST MU ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Micron Technology Inc.'s common stock (NASDAQ: MU) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	1.26%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	2.28%
Fee Waiver/Reimbursements [(3)]	-1.10%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.18%

(1) Other Expenses are based on actual amounts incurred during the Fund's fiscal period ended June 30, 2026.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's fiscal year ending June 30, 2027.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years	5 Years	10 Years
$ 120	$ 607	$ 1,120	$ 2,530

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it, directly or indirectly through a subsidiary, buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in annual fund operating expenses or in the Example, affect the Fund's performance. During the most recent fiscal year, the Fund's portfolio turnover rate was 0% of the average value of its portfolio, since the Fund invested only in instruments that are excluded from portfolio turnover rate calculations. However, if the Fund's use of derivatives were reflected, the Fund's portfolio turnover rate would be higher.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Direxion Daily MU Bull 2X Shares (NASDAQ: MUU). Investors can access information about MUU, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-150525 and 811-22201. This information, derived from MUU's filings with the SEC, is essential for investors to understand MUU's operations, investment strategy, and financial prospects. The description of MUU's principal investment strategies as outlined here is directly sourced from its prospectus.
(2) GraniteShares 2X Long MU ETF (NASDAQ: MULL). Investors can access information about MULL, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-214796 and 811 -23214. This information, derived from MULL's filings with the SEC, is essential for investors to understand MULL's operations, investment strategy, and financial prospects. The description of MULL's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the semi-conductor industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. MULL is affiliated with the Fund and both funds are issued under GraniteShares ETF Trust. The Trust and the Adviser have been directly involved in the preparation of the disclosure of MULL's publicly available documents. In connection with MUU none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding MUU is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of MUU.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH MUU, IT TRUSTS, AND ITS SERVICE PROVIDERS.

THE FUND, TRUST AND ADVISER ARE AFFILIATED WITH MULL.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the semiconductor industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock performance may be affected by global markets and demand for its products and services, its ability to develop new products and services, inventory levels, supply chain issues, the performance of third-party software developers, system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the semiconductor industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with limited operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: The Fund has not yet completed a full calendar year as of the date of this prospectus and therefore does not have a performance history for a full calendar year. Once available, the Fund's performance information will be accessible on the Fund's website at www.graniteshares.com and will provide some indication of the risks of investing in the Fund by showing changes in the Fund's performance and by showing how the Fund's returns compare with those of a broad measure of market performance. The Fund's past performance (before and after taxes) is not necessarily an indication of how the Fund will perform in the future.

Portfolio Managers: Jeff Klearman and Ryan Dofflemeyer have been portfolio managers of the Fund since the Fund's inception. Jeroen Visser has been portfolio manager of the Fund since September 2026.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST NBIS ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Nebius Group NV's common stock (NASDAQ: NBIS) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 3: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) GraniteShares 2x Long NBIS Daily ETF (NASDAQ: NBIL). Investors can access information about NBIL, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-214796 and 811-2314. This information, derived from NBIL's filings with the SEC, is essential for investors to understand NBIL's operations, investment strategy, and financial prospects. The description of NBIL's principal investment strategies as outlined here is directly sourced from its prospectus.

(2) Tradr 2X Long NBIS Daily ETF (NASDAQ: NEBX). Investors can access information about NEBX, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-191476 and 811-22894. This information, derived from NEBX's filings with the SEC, is essential for investors to understand NEBX's operations, investment strategy, and financial prospects. The description of NEBX's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the electronic data processing (EDP) industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. NBIL is affiliated with the Fund and both funds are issued under GraniteShares ETF Trust. The Trust and the Adviser have been directly involved in the preparation of the disclosure of NBIL's publicly available documents. In connection with NEBX none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to the fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding NEBX is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of NEBX.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH NEBX, THEIR TRUSTS, AND THEIR SERVICE PROVIDERS.

THE FUND, TRUST AND ADVISER ARE AFFILIATED WITH NBIL.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the electronic data processing industry. Any data breaches, unauthorized access, data loss due to system malfunctions, cyberattacks, privacy violations, data integrity issues, system outages, hardware failures, software vulnerabilities, human error, and power disruptions; essentially, any threat that could compromise the confidentiality, integrity, or availability of stored or processed data could have a material adverse effect on our company, its prospects and financial performance. Worldwide economic conditions could have an effect on the demand for our company's services and products and could result in declining revenue and earnings. General economic declines or a softening of the economy make it more likely that our company may experience difficulties collecting accounts receivable, sales and demand for our company's products may decrease, and our company's operating results may be adversely affected. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF. Unaffiliated Underlying Leveraged ETF do not pay fee to the Adviser.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST NFLX ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Netflix, Inc.'s common stock (NASDAQ: NFLX) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying NLFX ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Direxion Daily NFLX Bull 2X Shares (NASDAQ: NFXL). Investors can access information about NFXL, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-150525 and 811-22201. This information, derived from NFXL's filings with the SEC, is essential for investors to understand NFXL's operations, investment strategy, and financial prospects. The description of NFXL's principal investment strategies as outlined here is directly sourced from its prospectus.
(2) T-REX 2X Long NFLX Daily Target ETF (Cboe BZX Exchange: NFLU). Investors can access information about NFLU, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-234544 and 811-23439. This information, derived from NFLU's filings with the SEC, is essential for investors to understand NFLU's operations, investment strategy, and financial prospects. The description of NFLU's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the software and information technology and the entertainment industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with NFXL and NFLU, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding NFXL and NFLU is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of NFXL and NFLU.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH NFXL AND NFLU, THEIR TRUSTS, AND THEIR SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to is subject to the risks of the software and information technology as well as the entertainment industries. The software and information technology industry is particularly vulnerable to rapid changes in technology product cycles, rapid product obsolescence, government regulation, and competition, both domestically and internationally, including competition from competitors with lower production costs. In addition, many information technology companies have limited product lines, markets, financial resources or personnel. The prices of information technology companies and companies that rely heavily on technology, especially those of smaller, less-seasoned companies, tend to be more volatile and less liquid than the overall market. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the information technology industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel. The entertainment industry is highly competitive and relies on consumer spending and the availability of disposable income for success. The prices of the securities of companies in the entertainment industry may fluctuate widely due to competitive pressures, heavy expenses incurred for research and development of products, problems related to bringing products to market, consumer preferences and rapid obsolescence of products. Legislative or regulatory changes and increased government supervision also may affect companies in the entertainment industry. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST NVDA ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on NVIDIA Corporation's common stock (NASDAQ: NVDA) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.12%
Recoupment of previously waived expenses	0.02%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.16%
Fee Waiver/Reimbursements/Fees Paid Indirectly [(3), (4)]	-0.02%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements/Fees Paid Indirectly [(1), (2), (3), (4)]	1.14%

(1) Other Expenses are based on actual amounts incurred during the Fund's fiscal period ended June 30, 2026.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's fiscal year ending June 30, 2027.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.
(4) The Funds' have a fee arrangement with its custodian which provides for custody fees to be reduced by Create/Redeem credits received by the custodian from Authorized Participants.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years	5 Years	10 Years
$ 116	$ 366	$ 636	$ 1,407

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it, directly or indirectly through a subsidiary, buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in annual fund operating expenses or in the Example, affect the Fund's performance. During the most recent fiscal year, the Fund's portfolio turnover rate was 0% of the average value of its portfolio, since the Fund invested only in instruments that are excluded from portfolio turnover rate calculations. However, if the Fund's use of derivatives were reflected, the Fund's portfolio turnover rate would be higher.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be 2 times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of that Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or that the Fund will pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to reference the following products as Underlying Leveraged ETF:

(1) Direxion Daily NVDA Bull 2X Shares (NASDAQ: NVDU). Investors can access information about NVDU, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-150525 and 811-22201. This information, derived from AAPU's filings with the SEC, is essential for investors to understand NVDU's operations, investment strategy, and financial prospects. The description of NVDU's principal investment strategies as outlined here is directly sourced from its prospectus.
(2) REX 2X Long NVIDIA Daily Target ETF (CBOE: NVDX). Investors can access information about NVDX, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-23444 and 811-23439. This information, derived from AAPX's filings with the SEC, is essential for investors to understand NVDX's operations, investment strategy, and financial prospects. The description of NVDX's principal investment strategies as outlined here is directly sourced from its prospectus.
(3) Leverage Shares 2x Long NVDA Daily ETF (NASDAQ: NVDG). Investors can access information about NVDG, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-271700 and 811-23872. This information, derived from NVDG's filings with the SEC, is essential for investors to understand NVDG's operations, investment strategy, and financial prospects. The description of NVDG's principal investment strategies as outlined here is directly sourced from its prospectus.
(4) GraniteShares 2x Long NVDA Daily ETF (NASDAQ: NVDL). Investors can access information about NVDL, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-214796 and 811-2314. This information, derived from NVDL's filings with the SEC, is essential for investors to understand NVDL's operations, investment strategy, and financial prospects. The description of NVDL's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the semiconductor industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. NVDL is affiliated with the Fund and both funds are issued under GraniteShares ETF Trust. The Trust and the Adviser have been directly involved in the preparation of the disclosure of NVDL's publicly available documents. In connection to NVDU, NVDX, and NVDG none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding NVDU, NVDX and NVDG is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of NVDU, NVDX and NVDG.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH NVDU, NVDX AND NVDG, THEIR TRUSTS, AND THEIR SERVICE PROVIDERS.

THE FUND, TRUST AND ADVISER ARE AFFILIATED WITH NVDL.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Industry Concentration Risk — The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the semiconductor industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk and the risk of natural disasters. The Underlying Stock performance may be affected by NVIDIA Corporation's ability to identify new products, technologies or services, global competition and business conditions, its dependence on third-party product manufacturers, product defect issues, cybersecurity breaches, and customer concentration. The Underlying Stock may also be affected by risks that affect the broader technology industry, including: government regulation; dramatic and often unpredictable changes in growth rates and competition for qualified personnel; heavy dependence on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability; and a small number of companies representing a large portion of the technology sector as a whole. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. that generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given month. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with limited operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so. U.S. trade disputes or other disputes with specific countries that could result in additional tariffs, trade barriers and/or investment restrictions in certain securities in those countries.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet completed a full calendar year of investment operations, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman and Ryan Dofflemeyer have been portfolio managers of the Fund since the Fund's inception. Jeroen Visser has been portfolio manager of the Fund since September 2026.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST NVO ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Novo Nordisk A/S's ADR (NYSE: NVO) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Defiance Daily Target 2X Long NOV ETF (NYSE: NVOX). Investors can access information about NVOX, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-264478 and 811-23793. This information, derived from NVOX's filings with the SEC, is essential for investors to understand NVOX's operations, investment strategy, and financial prospects. The description of NVOX's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the healthcare sector and pharmaceutical industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection to NOVX, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to the fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding NOVX is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of NOVX.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH NOVX, ITS TRUSTS, AND ITS SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the healthcare sector and pharmaceutical industry. The profitability of companies in the healthcare sector may be affected by extensive, costly and uncertain government regulation, restrictions on government reimbursement for medical expenses, rising costs of medical products and services, pricing pressure (including price discounting), changes in the demand for medical products and services, an increased emphasis on outpatient services, limited product lines, industry innovation and/or consolidation, changes in technologies and other market developments. Many healthcare companies are heavily dependent on obtaining and defending patents, which may be time consuming and costly. The expiration of patents may adversely affect the profitability of these companies. Many healthcare companies are subject to extensive litigation based on product liability and similar claims. In addition, their products can become obsolete due to industry innovation, changes in technologies or other market developments. Many new products in the health care sector require significant research and development and may be subject to regulatory approvals, all of which may be time-consuming and costly with no guarantee that any product will come to market.

The profitability of pharmaceutical companies is highly dependent on the development, procurement and marketing of drugs and the development, protection and exploitation of intellectual property rights and other proprietary information. These companies may be significantly affected by the expiration of patents or the loss of, or the inability to enforce, intellectual property rights. Research and other costs associated with developing or procuring new drugs and the related intellectual property rights can be significant and may not be successful. Many pharmaceutical companies face intense competition from new products and less costly generic products, which may make it difficult to raise the prices of their products and may result in price discounting. In addition, the process for obtaining regulatory approval from the U.S. Food and Drug Administration or other governmental regulatory authorities is long and costly and there is no assurance that the necessary approvals will be obtained or maintained by these companies.

These companies may be adversely affected by government regulation and changes in reimbursement rates from third-party payors, such as Medicare, Medicaid and other government-sponsored programs, private health insurance plans and health maintenance organizations. The profitability of these companies may be dependent on a relatively limited number of products. Additionally, their products can become obsolete due to industry innovation, changes in technologies or other market developments.

The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF. Unaffiliated Underlying Leveraged ETF do not pay fee to the Adviser.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST OKLO ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Oklo Inc.'s common stock (NYSE: OKLO) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

No Fund's investment objective has been adopted as a fundamental investment policy and therefore each Fund's investment objective along with its respective 80% investment policy may be changed without the consent of that Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Defiance Daily Target 2X Long OKLO ETF (NASDAQ: OKLL). Investors can access information about OKLL, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-264478 and 811-23793. This information, derived from OKLL's filings with the SEC, is essential for investors to understand OKLL's operations, investment strategy, and financial prospects. The description of OKLL's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the industrials sector and electrical equipment industries.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection to OKLL, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding OKLL is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of OKLL.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH OKLL, ITS TRUSTS, AND ITS SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk — The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of industrials sector and electrical equipment industries. The electrical equipment industry can be significantly affected by general economic trends, including employment, economic growth, interest rates, and changes in commodity prices. Electrical equipment companies are subject to the risks of technical obsolescence, and their profitability may be affected by government regulation and spending, import controls and worldwide competition. Companies in these industries also can be adversely affected by liability for environmental damage, depletion of resources, and mandated expenditures for safety and pollution control. These factors may result in a material adverse impact on the Fund's portfolio securities and the performance of the Fund The electrical equipment industry can be significantly affected by general economic trends, including employment, economic growth, interest rates, and changes in commodity prices. Electrical equipment companies are subject to the risks of technical obsolescence, and their profitability may be affected by government regulation and spending, import controls and worldwide competition. Companies in these industries also can be adversely affected by liability for environmental damage, depletion of resources, and mandated expenditures for safety and pollution control. These factors may result in a material adverse impact on the Fund's portfolio securities and the performance of the Fund. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF. Unaffiliated Underlying Leveraged ETF do not pay fee to the Adviser.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST ORCL ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Oracle Corporation's common stock (NYSE: ORCL) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Defiance Daily Target 2X Long ORCL ETF (NYSE: ORCX). Investors can access information about ORCX, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-264478 and 811-23793. This information, derived from ORCX's filings with the SEC, is essential for investors to understand ORCX's operations, investment strategy, and financial prospects. The description of ORCX's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the computer software industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with ORCX none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to the fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding ORCX is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of ORCX.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH ORCX, IT TRUSTS, AND ITS SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the software and information technology industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock performance may be affected by significant customer losses, its inability to develop and implement new technologies, its reliance on third-party distributors and platforms, cybersecurity attacks, its inability to protect its intellectual property rights and global laws and regulations affecting privacy, data protection and technology protections. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF. Unaffiliated Underlying Leveraged ETF do not pay fee to the Adviser.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST PANW ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Palo Alto Networks, Inc.'s common stock (NASDAQ: PANW) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Direxion Daily PANW Bull 2X Shares (NASDAQ: PALU). Investors can access information about PALU, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-150525 and 811-22201. This information, derived from PALU's filings with the SEC, is essential for investors to understand PALU's operations, investment strategy, and financial prospects. The description of PALU's principal investment strategies as outlined here is directly sourced from its prospectus.
(2) Leverage Shares 2X Long PANW ETF (NASDAQ: PANG). Investors can access information about PANG, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-271700 and 811-23872. This information, derived from PANG's filings with the SEC, is essential for investors to understand PANG's operations, investment strategy, and financial prospects. The description of PANG's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the software and information technology industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with PALU and PANG, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding PALU and PANG is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of PALU and PANG.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH NFXL AND NFLU, THEIR TRUSTS, AND THEIR SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the software and information technology industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk and the risk of natural disasters. The Underlying Stock performance may be affected by global markets and demand for its products and services, its ability to develop new products and services, inventory levels, supply chain issues, the performance of third-party software developers, system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the information technology industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF. Unaffiliated Underlying Leveraged ETF do not pay fee to the Adviser.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST PDD ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on PDD Holdings Inc.'s ADR (NYSE: PDD) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

No Fund's investment objective has been adopted as a fundamental investment policy and therefore each Fund's investment objective along with its respective 80% investment policy may be changed without the consent of that Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying PDDETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) KraneShares Daily PDD Bull 2X Shares (NASDAQ: KPDD). Investors can access information about KPDD, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-180870 and 811-22698. This information, derived from KPDD's filings with the SEC, is essential for investors to understand KPDD's operations, investment strategy, and financial prospects. The description of KPDD's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the business services industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with KPDD, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding KPDD is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of KPDD.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH KPDD, THEIR TRUSTS, AND THEIR SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the business services industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but are not limited to any general economic, business or industry conditions that cause customers or potential customers to reduce or delay their purchases of business services or other products could have a material adverse effect on our company, its prospects and financial performance. Worldwide economic conditions could have an effect on the demand for our company's services and products and could result in declining revenue and earnings. General economic declines or a softening of the economy make it more likely that our company may experience difficulties collecting accounts receivable, sales and demand for our company's products may decrease, and our company's operating results may be adversely affected. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST PLTR ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Palantir Technologies Inc.'s common stock (NASDAQ: PLTR) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.84%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.86%
Fee Waiver/Reimbursements/Fees Paid Indirectly [(3), (4)]	-0.68%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements/Fees Paid Indirectly [(1), (2), (3), (4)]	1.18%

(1) Other Expenses are based on actual amounts incurred during the Fund's fiscal period ended June 30, 2026.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's fiscal year ending June 30, 2027.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.
(4) The Funds' have a fee arrangement with its custodian which provides for custody fees to be reduced by Create/Redeem credits received by the custodian from Authorized Participants.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years	5 Years	10 Years
$ 120	$ 519	$ 943	$ 2,124

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it, directly or indirectly through a subsidiary, buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in annual fund operating expenses or in the Example, affect the Fund's performance. During the most recent fiscal year, the Fund's portfolio turnover rate was 0% of the average value of its portfolio, since the Fund invested only in instruments that are excluded from portfolio turnover rate calculations. However, if the Fund's use of derivatives were reflected, the Fund's portfolio turnover rate would be higher.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Direxion Daily PLTR Bull 2X Shares (NASDAQ: PLTU). Investors can access information about PLTU, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-150525 and 811-22201. This information, derived from PLTU's filings with the SEC, is essential for investors to understand PLTU's operations, investment strategy, and financial prospects. The description of PLTU's principal investment strategies as outlined here is directly sourced from its prospectus.
(2) Leverage Shares 2x Long PLTR Daily ETF (NASDAQ: PLTG). Investors can access information about PLTG, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-271700 and 811-23872. This information, derived from PLTG's filings with the SEC, is essential for investors to understand PLTG's operations, investment strategy, and financial prospects. The description of PLTG's principal investment strategies as outlined here is directly sourced from its prospectus.
(3) GraniteShares 2x Long PLTR Daily ETF (NASDAQ: PTIR). Investors can access information about PTIR, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-214796 and 811-2314. This information, derived from PTIR's filings with the SEC, is essential for investors to understand PTIR's operations, investment strategy, and financial prospects. The description of PTIR's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the computer software industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. PTIR is affiliated with the Fund and both funds are issued under GraniteShares ETF Trust. The Trust and the Adviser have been directly involved in the preparation of the disclosure of PTIR's publicly available documents. In connection to PLTU and PLTG, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding PLTU and PLTG is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of PLTU and PLTG.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH PLTU AND PTLG, THEIR TRUSTS, AND THEIR SERVICE PROVIDERS.

THE FUND, TRUST AND ADVISER ARE AFFILIATED WITH PTIR.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the software and information technology industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions other trade barriers and the risk of natural disasters. The Underlying Stock performance may be affected by significant customer losses, its inability to develop and implement new technologies, its reliance on third-party distributors and platforms, cybersecurity attacks, its inability to protect its intellectual property rights and global laws and regulations affecting privacy, data protection and technology protections. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with limited operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: The Fund has not yet completed a full calendar year as of the date of this prospectus and therefore does not have a performance history for a full calendar year. Once available, the Fund's performance information will be accessible on the Fund's website at www.graniteshares.com and will provide some indication of the risks of investing in the Fund by showing changes in the Fund's performance and by showing how the Fund's returns compare with those of a broad measure of market performance. The Fund's past performance (before and after taxes) is not necessarily an indication of how the Fund will perform in the future.

Portfolio Managers: Jeff Klearman and Ryan Dofflemeyer have been portfolio managers of the Fund since the Fund's inception. Jeroen Visser has been portfolio manager of the Fund since September 2026.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST QBTS ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on D-Wave Quantum, Inc.'s common stock (NYSE: QBTS) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [1]	3.23%
Acquired Fund Fees and Expenses [2]	0.03%
Total Annual Fund Operating Expenses	4.25%
Fee Waiver/Reimbursements/Fees Paid Indirectly [3], [4]	-3.07%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements/Fees Paid Indirectly [1], [2], [3], [4]	1.18%

(1) Other Expenses are based on actual amounts incurred during the Fund's fiscal period ended June 30, 2026.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's fiscal year ending June 30, 2027.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.
(4) The Funds' have a fee arrangement with its custodian which provides for custody fees to be reduced by Create/Redeem credits received by the custodian from Authorized Participants.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years	5 Years	10 Years
$ 120	$ 1,009	$ 1,912	$ 4,228

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it, directly or indirectly through a subsidiary, buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in annual fund operating expenses or in the Example, affect the Fund's performance. During the most recent fiscal year, the Fund's portfolio turnover rate was 0% of the average value of its portfolio, since the Fund invested only in instruments that are excluded from portfolio turnover rate calculations. However, if the Fund's use of derivatives were reflected, the Fund's portfolio turnover rate would be higher.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Tradr 2X Long QBTS Daily ETF (NASDAQ: QBTX). Investors can access information about QBTX, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-191476 and 811-22894. This information, derived from QBTX's filings with the SEC, is essential for investors to understand QBTX's operations, investment strategy, and financial prospects. The description of QBTX's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the electronic data processing (EDP) industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with QBTX, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding QBTX is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of QBTX.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH QBTX, ITS TRUSTS, AND ITS SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the electronic data processing industry. Any data breaches, unauthorized access, data loss due to system malfunctions, cyberattacks, privacy violations, data integrity issues, system outages, hardware failures, software vulnerabilities, human error, and power disruptions; essentially, any threat that could compromise the confidentiality, integrity, or availability of stored or processed data could have a material adverse effect on our company, its prospects and financial performance. Worldwide economic conditions could have an effect on the demand for our company's services and products and could result in declining revenue and earnings. General economic declines or a softening of the economy make it more likely that our company may experience difficulties collecting accounts receivable, sales and demand for our company's products may decrease, and our company's operating results may be adversely affected. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with limited operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: The Fund has not yet completed a full calendar year as of the date of this prospectus and therefore does not have a performance history for a full calendar year. Once available, the Fund's performance information will be accessible on the Fund's website at www.graniteshares.com and will provide some indication of the risks of investing in the Fund by showing changes in the Fund's performance and by showing how the Fund's returns compare with those of a broad measure of market performance. The Fund's past performance (before and after taxes) is not necessarily an indication of how the Fund will perform in the future.

Portfolio Managers: Jeff Klearman and Ryan Dofflemeyer have been portfolio managers of the Fund since the Fund's inception. Jeroen Visser has been portfolio manager of the Fund since September 2026.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST QQQ ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 3 times (300%) the income generated from selling options on the Nasdaq-100® Index (the "Underlying Index") by selling options on leveraged exchange-traded funds designed to deliver 3 times (300%) the daily performance of the Underlying Index (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below**.

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.52%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.54%
Fee Waiver/Reimbursements/Fees Paid Indirectly [(3), (4)]	-0.36%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements/Fees Paid Indirectly [(1), (2), (3), (4)]	1.18%

(1) Other Expenses are based on actual amounts incurred during the Fund's fiscal period ended June 30, 2026.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's fiscal year ending June 30, 2027.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.
(4) The Funds' have a fee arrangement with its custodian which provides for custody fees to be reduced by Create/Redeem credits received by the custodian from Authorized Participants.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years	5 Years	10 Years
$ 120	$ 451	$ 805	$ 1,804

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it, directly or indirectly through a subsidiary, buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in annual fund operating expenses or in the Example, affect the Fund's performance. During the most recent fiscal year, the Fund's portfolio turnover rate was 0% of the average value of its portfolio, since the Fund invested only in instruments that are excluded from portfolio turnover rate calculations. However, if the Fund's use of derivatives were reflected, the Fund's portfolio turnover rate would be higher.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 3 times the daily performance of the Underlying Index. It is expected that the implied volatility on the Underlying Leveraged ETF to be three times the level of the Underlying Index's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, three times the premium generated by selling options on the Underlying Index. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Index.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be three times the losses compared to the Underlying Index. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of that Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or that the Fund will pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF.

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Index directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1-month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3 shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF, the ProShares UltraPro® QQQ, is a passively managed fund that seeks daily investment results, before fees and expenses, of 300% of the performance of the Nasdaq-100® (the "Underlying Index").

The Underlying Index is constructed and maintained by Nasdaq Inc. The Underlying Index includes 100 of the largest domestic and international non-financial companies listed on The Nasdaq Stock Market based on market capitalization. The Underlying Index reflects companies across major industry groups including computer hardware and software, telecommunications, retail/wholesale trade and biotechnology.

The Underlying Leveraged ETF may invest in the securities of the Underlying Index, a representative sample of the securities in the Underlying Index that has aggregate characteristics similar to those of the Underlying Index, an ETF that tracks the Underlying Index or a substantially similar index, and may utilize derivatives, such as swaps or futures on the Underlying Index or on an ETF that tracks the same Underlying Index or a substantially similar index, that provide leveraged exposure to the above.

Investors can access information about the Underlying Leveraged ETF, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-89822 and 811-2114. This information, derived from the Underlying Leveraged ETF's filings with the SEC, is essential for investors to understand the Underlying Leveraged ETF's operations, investment strategy, and financial prospects. The description of the Underlying Leveraged ETF's principal investment strategies as outlined here is directly sourced from its prospectus.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with the offering of the securities, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to the Underlying Leveraged ETF. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding the Underlying Leveraged ETF is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of the Underlying Leveraged ETF.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH PROSHARES TRUST, THE UNDERLYING LEVERAGED ETF, PROSHARES ADVISORS LLC OR NASDAQ INC.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 300% of the Underlying Index's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Index during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Index will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 3% for every 1% daily decline in the Underlying Index, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Index decline of more than 33%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Industry Concentration Risk — The Nasdaq-100® index may have a significant portion of its value in issuers in an industry or group of industries. The Underlying Leveraged ETF will allocate its investments to approximately the same extent as the Nasdaq-100® index. As a result, the Underlying Leveraged ETF may be subject to greater market fluctuations than a fund that is more broadly invested across industries. As of September 30, 2026, the Nasdaq-100® index had a significant portion of its value in issuers in the information technology (68%) and consumer discretionary (15%) sectors.

Indirect Investments in the Underlying Leveraged ETF. The Underlying Leveraged ETF is not affiliated with the Trust, the Fund, the Adviser, or their respective affiliates and is not involved with the offering of the Fund in any way and has no obligation to consider your Shares in taking any corporate action that might affect the value of Shares. Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Passive Investment and Underlying Index Performance Risk. Investment in the Fund should be made with the understanding that the passive Underlying Leveraged ETF in which the Fund invests will not be able to replicate exactly the performance of the indices they track because the total return generated by the securities will be reduced by transaction costs incurred in adjusting the actual balance of the securities. In addition, the passive Underlying Leveraged ETF in which the Fund invests will incur expenses not incurred by their applicable indices. Certain securities comprising the indices tracked by the passive Underlying Leveraged ETF may, from time to time, temporarily be unavailable, which may further impede the passive Underlying Leveraged ETF's ability to track their applicable indices.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Flex Option Risk: Trading FLEX Options involves risks different from, or possibly greater than, the risks associated with investing directly in securities. The Fund may experience losses from specific FLEX Option positions and certain FLEX Option positions may expire worthless. The FLEX Options are listed on an exchange; however, no one can guarantee that a liquid secondary trading market will exist for the FLEX Options. In the event that trading in the FLEX Options is limited or absent, the value of the Fund's FLEX Options may decrease. In a less liquid market for the FLEX Options, liquidating the FLEX Options may require the payment of a premium (for written FLEX Options) or acceptance of a discounted price (for purchased FLEX Options) and may take longer to complete. A less liquid trading market may adversely impact the value of the FLEX Options and Fund shares and result in the Fund being unable to achieve its investment objective. Less liquidity in the trading of the Fund's FLEX Options could have an impact on the prices paid or received by the Fund for the FLEX Options in connection with creations and redemptions of the Fund's shares. Depending on the nature of this impact to pricing, the Fund may be forced to pay more for redemptions (or receive less for creations) than the price at which it currently values the FLEX Options. Such overpayment or under collection could reduce the Fund's ability to achieve its investment objective. Additionally, in a less liquid market for the FLEX Options, the liquidation of a large number of options may more significantly impact the price. A less liquid trading market may adversely impact the value of the FLEX Options and the value of your investment. The trading in FLEX Options may be less deep and liquid than the market for certain other exchange-traded options, non-customized options or other securities.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. that generate specific risks.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given month. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 10% in-the-money and their maturity from 1-week to 1-month. Selling put option contracts with longer maturities may increase the volatility of the strategy. Selling put option contracts that are more in-the-money may increase the volatility of the strategy.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). There are a limited number of financial institutions that post collateral for certain trades on an agency basis (i.e. on behalf of other market participants). Accordingly, there are a limited number of financial institutions that may act as Authorized Participants that post collateral for certain trades on an agency basis (i.e. on behalf of other market participants. In such circumstances, the Fund's market price may be significantly different than its underlying net asset value. In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with limited operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so. U.S. trade disputes or other disputes with specific countries that could result in additional tariffs, trade barriers and/or investment restrictions in certain securities in those countries.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC. The Fund intends to treat any income it may derive from the options and swap contracts as "qualifying income" under the provisions of the Code applicable to RICs. If the income is not qualifying income the Fund may lose its status as a RIC. The Fund will, for each year, distribute substantially all of its net investment income and net capital gains.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet completed a full calendar year of investment operations, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman and Ryan Dofflemeyer have been portfolio managers of the Fund since the Fund's inception. Jeroen Visser has been portfolio manager of the Fund since September 2026.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST QUBT ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Quantum Computing Inc.'s common stock (NASDAQ: QUBT) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1-month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1-month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying PDDETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Tradr 2X Long QUBT Daily ETF (NASDAQ: QUBX). Investors can access information about QUBX, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-191476 and 811-22894. This information, derived from QUBX's filings with the SEC, is essential for investors to understand QUBX's operations, investment strategy, and financial prospects. The description of QUBX's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the electronic data processing (EDP) industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with QUBX, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to the fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding QUBX is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of QUBX.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH QUBX, ITS TRUSTS, AND ITS SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the electronic data processing industry. Any data breaches, unauthorized access, data loss due to system malfunctions, cyberattacks, privacy violations, data integrity issues, system outages, hardware failures, software vulnerabilities, human error, and power disruptions; essentially, any threat that could compromise the confidentiality, integrity, or availability of stored or processed data could have a material adverse effect on our company, its prospects and financial performance. Worldwide economic conditions could have an effect on the demand for our company's services and products and could result in declining revenue and earnings. General economic declines or a softening of the economy make it more likely that our company may experience difficulties collecting accounts receivable, sales and demand for our company's products may decrease, and our company's operating results may be adversely affected. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF. Unaffiliated Underlying Leveraged ETF do not pay fee to the Adviser.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST RBLX ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Roblox Corp's common stock (NYSE: RBLX) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) T-REX 2X Long RBLX Daily Target ETF (Cboe BZX Exchange: RBLU). Investors can access information about RBLU, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-234544 and 811-23439. This information, derived from RBLU's filings with the SEC, is essential for investors to understand RBLU's operations, investment strategy, and financial prospects. The description of RBLU's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the communication services and the entertainment industries.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with RBLU, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to the fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding RBLU is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of RBLU.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH RBLU, ITS TRUSTS, AND ITS SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the communication services and the entertainment industries. The performance of companies in the communication services industry may be affected by (without limitation) the following factors: industry competition, increasing governmental regulation, the ability to keep pace with technological advancement and scrutiny by public bodies. Technological innovations may reduce the utility of products and services of companies in the communication services sector and render them less competitive or obsolete over time. These companies may need to commit substantial capital investment to deal with increasing competition and to keep pace with technological enhancement in order to remain competitive. The entertainment industry is highly competitive and relies on consumer spending and the availability of disposable income for success. The prices of the securities of companies in the entertainment industry may fluctuate widely due to competitive pressures, heavy expenses incurred for research and development of products, problems related to bringing products to market, consumer preferences and rapid obsolescence of products. Legislative or regulatory changes and increased government supervision also may affect companies in the entertainment industry. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF. Unaffiliated Underlying Leveraged ETF do not pay fee to the Adviser.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST RDDT ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Reddit, Inc.'s common stock (NYSE: RDDT) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) GraniteShares 2x Long RDDT Daily ETF (NASDAQ: RDTL). Investors can access information about RDTL, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-214796 and 811-2314. This information, derived from RDTL's filings with the SEC, is essential for investors to understand RDTL's operations, investment strategy, and financial prospects. The description of RDTL's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Fund's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the electronic data processing (EDP) industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. RDTL is affiliated with the Fund and both funds are issued under GraniteShares ETF Trust. The Trust and the Adviser have been directly involved in the preparation of the disclosure of RDTL's publicly available documents. The Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

THE FUND, TRUST AND ADVISER ARE AFFILIATED WITH RDTL.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the electronic data processing industry. Any data breaches, unauthorized access, data loss due to system malfunctions, cyberattacks, privacy violations, data integrity issues, system outages, hardware failures, software vulnerabilities, human error, and power disruptions; essentially, any threat that could compromise the confidentiality, integrity, or availability of stored or processed data could have a material adverse effect on our company, its prospects and financial performance. Worldwide economic conditions could have an effect on the demand for our company's services and products and could result in declining revenue and earnings. General economic declines or a softening of the economy make it more likely that our company may experience difficulties collecting accounts receivable, sales and demand for our company's products may decrease, and our company's operating results may be adversely affected. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF. Unaffiliated Underlying Leveraged ETF do not pay fee to the Adviser.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST RGTI ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Rigetti Computing, Inc.'s common stock (NYSE: RGTI) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	2.59%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	3.61%
Fee Waiver/Reimbursements/Fees Paid Indirectly [(3), (4)]	-2.43%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements/Fees Paid Indirectly [(1), (2), (3), (4)]	1.18%

(1) Other Expenses are based on actual amounts incurred during the Fund's fiscal period ended June 30, 2026.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's fiscal year ending June 30, 2027.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.
(4) The Funds' have a fee arrangement with its custodian which provides for custody fees to be reduced by Create/Redeem credits received by the custodian from Authorized Participants.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years	5 Years	10 Years
$ 120	$ 880	$ 1,662	$ 3,712

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it, directly or indirectly through a subsidiary, buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in annual fund operating expenses or in the Example, affect the Fund's performance. During the most recent fiscal year, the Fund's portfolio turnover rate was 0% of the average value of its portfolio, since the Fund invested only in instruments that are excluded from portfolio turnover rate calculations. However, if the Fund's use of derivatives were reflected, the Fund's portfolio turnover rate would be higher.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Defiance Daily Target 2X Long RGTI ETF (NYSE: RGTX). Investors can access information about RGTX, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-264478 and 811-23793. This information, derived from RGTX's filings with the SEC, is essential for investors to understand RGTX's operations, investment strategy, and financial prospects. The description of RGTX's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the electronic data processing (EDP) industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with RGTX, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding RGTX is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of RGTX.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH RGTX, ITS TRUSTS, AND ITS SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the electronic data processing industry. Any data breaches, unauthorized access, data loss due to system malfunctions, cyberattacks, privacy violations, data integrity issues, system outages, hardware failures, software vulnerabilities, human error, and power disruptions; essentially, any threat that could compromise the confidentiality, integrity, or availability of stored or processed data could have a material adverse effect on our company, its prospects and financial performance. Worldwide economic conditions could have an effect on the demand for our company's services and products and could result in declining revenue and earnings. General economic declines or a softening of the economy make it more likely that our company may experience difficulties collecting accounts receivable, sales and demand for our company's products may decrease, and our company's operating results may be adversely affected. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with limited operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet completed a full calendar year of investment operations, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman and Ryan Dofflemeyer have been portfolio managers of the Fund since the Fund's inception. Jeroen Visser has been portfolio manager of the Fund since September 2026.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST RIOT ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Riot Platforms, Inc.'s common stock (NASDAQ: RIOT) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	1.30%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	2.32%
Fee Waiver/Reimbursements/Fees Paid Indirectly [(3), (4)]	-1.14%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements/Fees Paid Indirectly [(1), (2), (3), (4)]	1.18%

(1) Other Expenses are based on actual amounts incurred during the Fund's fiscal period ended June 30, 2026.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's fiscal year ending June 30, 2027.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.
(4) The Funds' have a fee arrangement with its custodian which provides for custody fees to be reduced by Create/Redeem credits received by the custodian from Authorized Participants.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years	5 Years	10 Years
$ 120	$ 615	$ 1,137	$ 2,568

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it, directly or indirectly through a subsidiary, buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in annual fund operating expenses or in the Example, affect the Fund's performance. During the most recent fiscal year, the Fund's portfolio turnover rate was 0% of the average value of its portfolio, since the Fund invested only in instruments that are excluded from portfolio turnover rate calculations. However, if the Fund's use of derivatives were reflected, the Fund's portfolio turnover rate would be higher.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 3: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Defiance Daily Target 2X Long RIOT ETF (NYSE: RIOX). Investors can access information about RIOX, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-264478 and 811-23793. This information, derived from RIOX's filings with the SEC, is essential for investors to understand RIOX's operations, investment strategy, and financial prospects. The description of RIOX's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the capital market services industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with RIOX, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding RIOX is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of RIOX.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH RIOT, ITS TRUSTS, AND ITS SERVICE PROVIDERS.

Additional Information on Bitcoin

Bitcoin is a digital asset that is created and transmitted through the operations of the online, peer-to-peer Bitcoin network, a decentralized network of computers that operates on cryptographic protocols. The ownership of bitcoin is determined by participants in the Bitcoin network. The Bitcoin network connects computers that run publicly accessible, or "open source," software that follows the rules and procedures governing the Bitcoin network. This is commonly referred to as the Bitcoin Protocol. Bitcoin, the asset, plays a key role in the operation of the Bitcoin network, as the computers (or "miners") that process transactions on the network and maintain the network's security are compensated through the issuance of new bitcoin and through transaction fees paid by users in bitcoin. No single entity owns or operates the Bitcoin network. Bitcoin is not issued by any government, by banks or similar organizations. The infrastructure of the Bitcoin network is collectively maintained by a decentralized user base. The Bitcoin network is accessed through software, and software governs the creation, movement, and ownership of "bitcoin," the unit of account on the Bitcoin network ledger. The value of bitcoin is determined, in part, by the supply of, and demand for, bitcoin in the global markets for trading bitcoin, market expectations for the adoption of bitcoin as a decentralized store of value, the number of merchants and/or institutions that accept bitcoin as a form of payment and the volume of private end-user-to-end-user transactions. Bitcoin transaction and ownership records are reflected on the "Bitcoin blockchain," which is a digital public record or ledger. Copies of this ledger are stored in a decentralized manner on the computers of each Bitcoin network node (a node is any user who maintains on their computer a full copy of all the bitcoin transaction records, the blockchain, as well as related software). Transaction data is permanently recorded in files called "blocks," which reflect transactions that have been recorded and authenticated by Bitcoin network participants. The Bitcoin network software source code includes protocols that govern the creation of new bitcoin and the cryptographic system that secures and verifies bitcoin transactions.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The Underlying Stock's business is highly competitive and operates 24 hours a day, 7 days a week, on a global basis. The primary drivers of competition are demand for bitcoin, sufficient capital resources to acquire large quantities of high-quality miners, the ability to secure these miners from a limited number of suppliers on rapid delivery schedules, and the ability to execute on those miner deployments with the best-in-class mining infrastructure to generate the highest returns while incurring the lowest costs to mine. The Underlying Stock's inability to maintain or improve market share versus its competitors could negatively impact its financial results. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Bitcoin Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to risks associated with bitcoin. Investing in bitcoin exposes to significant risks that are not typically present in other investments. These risks include the uncertainty surrounding new technology, limited evaluation due to bitcoin's short trading history, and the potential decline in adoption and value over the long term. The extreme volatility of bitcoin's price is also a risk factor. Regulatory uncertainties, such as potential government interventions and conflicting regulations across jurisdictions, can impact the demand for bitcoin and restrict its usage. Bitcoin is not presently widely accepted as a medium of exchange, which may be due to a number of common impediments and/or disadvantages to adopting the Bitcoin Network as a payment network, including the slowness of transaction processing and finality, variability of transaction fees, and volatility of the price of bitcoin. Additionally, risks associated with the sale of newly mined bitcoin, bitcoin trading platforms, competition from alternative digital assets, mining operations, network modifications, and intellectual property claims pose further challenges to bitcoin-linked investments. The value of bitcoin has been, may continue to be, substantially dependent on speculation, such that trading and investing in these assets generally may not be based on fundamental analysis. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Bitcoin Halving. While bitcoin prices have historically increased around halving events (a process designed to control the overall supply and reduce the risk of inflation in bitcoin, which uses a proof-of-work consensus algorithm and results in the mining reward being cut in half) there is no guarantee that the price change will be favorable or would compensate for the reduction in mining rewards. If a corresponding and proportionate increase in the price of Bitcoin does not follow future halving events, the revenue the Underlying Stock earns from its bitcoin mining operations would see a decrease, which could have a material adverse effect on the Underlying Stock's results of operations and financial condition.

Hash Rate and Difficulty. As demand for bitcoin has increased, the global network hash rate (i.e., the aggregate amount of computing power devoted to supporting the bitcoin blockchain at a given time) has increased rapidly, and as greater adoption of bitcoin occurs, it is expected that demand for new bitcoin will likewise increase as more mining companies are drawn into the industry by this increased demand. Further, as a greater number of increasingly powerful miners have been deployed, the network difficulty for bitcoin has consequently also increased. A high difficulty means that more computing power will be required in order to solve a block and earn a new bitcoin reward, which, in turn, makes the bitcoin network more secure by limiting the possibility of one miner or mining pool gaining control of the network. Therefore, as new and existing miners deploy additional hash rate, the global network hash rate will continue to increase, meaning a miner's share of the global network hash rate (and therefore its chance of earning bitcoin rewards) will decline if it fails to deploy additional hash rate at pace with the industry. If an effort to grow the hash rate, results in the inability to complete planned expansions on schedule and within anticipated cost estimates, deployment of newly purchased miners may be delayed, which could affect its competitiveness and results of operation, which could have a material adverse effect on the Underlying Stock's financial condition and market price for its securities.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with limited operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: The Fund has not yet completed a full calendar year as of the date of this prospectus and therefore does not have a performance history for a full calendar year. Once available, the Fund's performance information will be accessible on the Fund's website at www.graniteshares.com and will provide some indication of the risks of investing in the Fund by showing changes in the Fund's performance and by showing how the Fund's returns compare with those of a broad measure of market performance. The Fund's past performance (before and after taxes) is not necessarily an indication of how the Fund will perform in the future.

Portfolio Managers: Jeff Klearman and Ryan Dofflemeyer have been portfolio managers of the Fund since the Fund's inception. Jeroen Visser has been portfolio manager of the Fund since September 2026.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST RIVN ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Rivian Automotive, Inc's common stock (NASDAQ: RIVN) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) GraniteShares 2x Long RIVN Daily ETF (NASDAQ: RVNL). Investors can access information about RVNL, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-214796 and 811-2314. This information, derived from RVNL's filings with the SEC, is essential for investors to understand RVNL's operations, investment strategy, and financial prospects. The description of RVNL's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in automative industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. RVNL is affiliated with the Fund and both funds are issued under GraniteShares ETF Trust. The Trust and the Adviser have been directly involved in the preparation of the disclosure of RVNL's publicly available documents. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

THE FUND, TRUST AND ADVISER ARE AFFILIATED WITH RVNL.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to risks of the automotive sector. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock has a limited operating history and evaluating its prospects is difficult. The Underlying Stock has incurred net losses each year since its inception and is expected to suffer substantial losses in the coming future. It has limited control over substantial costs associated with its operations. The automotive sector industry can be highly cyclical, and companies in the industry may suffer periodic operating losses. Automotive companies can be significantly affected by labor relations and fluctuating component prices. Governmental policies affecting the automotive industry, such as taxes, tariffs, duties, subsidies, and import and export restrictions on automotive products can influence industry profitability. In addition, such companies must comply with environmental laws and regulations, for which there may be severe consequences for non-compliance. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST SEMICONDUCTOR ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 3 times (300%) the income generated from selling options on the NYSE Semiconductor Index (the "Underlying Index") by selling options on leveraged exchange-traded funds designed to deliver 3 times (300%) the daily performance of the Underlying Index (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [1]	0.14%
Acquired Fund Fees and Expenses [2]	0.03%
Total Annual Fund Operating Expenses	1.16%
Fee Waiver/Reimbursements/Fees Paid Indirectly [3], [4]	-0.02%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements/Fees Paid Indirectly [1], [2], [3], [4]	1.14%

(1) Other Expenses are based on actual amounts incurred during the Fund's fiscal period ended June 30, 2026.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's fiscal year ending June 30, 2027.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.
(4) The Funds' have a fee arrangement with its custodian which provides for custody fees to be reduced by Create/Redeem credits received by the custodian from Authorized Participants.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years	5 Years	10 Years
$ 116	$ 366	$ 636	$ 1,407

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it, directly or indirectly through a subsidiary, buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in annual fund operating expenses or in the Example, affect the Fund's performance. During the most recent fiscal year, the Fund's portfolio turnover rate was 0% of the average value of its portfolio, since the Fund invested only in instruments that are excluded from portfolio turnover rate calculations. However, if the Fund's use of derivatives were reflected, the Fund's portfolio turnover rate would be higher.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 3 times the daily performance of the Underlying Index. It is expected that the implied volatility on the Underlying Leveraged ETF to be three times the level of the Underlying Index's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, three times the premium generated by selling options on the Underlying Index. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Index.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be three times the losses compared to the Underlying Index. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Options Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of that Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or that the Fund will pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivative Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Index directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may sell Flexible Exchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF, Direxion Daily Semiconductor Bull 3X Shares, is a passively managed fund that seeks daily investment results, before fees and expenses, of 300% of the performance of the NYSE Semiconductor Index (the "Underlying Index").

The Underlying Index is provided by ICE Data Indices, LLC (the "Index Provider") and is a rules-based, modified float-adjusted market capitalization-weighted index that tracks the performance of the thirty largest U.S. listed semiconductor companies. Semiconductor companies are defined as those classified within the Semiconductor Industry of the ICE Uniform Sector Classification schema. This includes companies that either manufacture materials that have electrical conductivity (semiconductors) to be used in electronic applications or utilize LED and OLED technology. This also includes companies that provide services or equipment associated with semiconductors such as packaging and testing.

The Underlying Leveraged ETF may invest in the securities of the Underlying Index, a representative sample of the securities in the Underlying Index that has aggregate characteristics similar to those of the Underlying Index, an ETF that tracks the Index or a substantially similar index, and may utilize derivatives, such as swaps or futures on the Underlying Index or on an ETF that tracks the same Underlying Index or a substantially similar index, that provide leveraged exposure to the above.

Investors can access information about the Underlying Leveraged ETF, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-150525 and 811-22201. This information, derived from the Underlying Leveraged ETF's filings with the SEC, is essential for investors to understand the Underlying Leveraged ETF's operations, investment strategy, and financial prospects. The description of the Underlying Leveraged ETF's principal investment strategies as outlined here is directly sourced from its prospectus.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with the offering of the securities, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to the Underlying Leveraged ETF. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding the Underlying Leveraged ETF is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of the Underlying Leveraged ETF.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH DIREXION SHARES TRUST ETF, THE UNDERLYING LEVERAGED ETF, RAFFERTY ASSET MANAGEMENT, LLC OR ICE DATA INDICES, LLC.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 300% of the Underlying Index's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Index during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Index will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 3% for every 1% daily decline in the Underlying Index, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Index decline of more than 33%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Industry Concentration Risk — The NYSE Semiconductor Index may have a significant portion of its value in issuers in an industry or group of industries. The Underlying Leveraged ETF will allocate its investments to approximately the same extent as the NYSE Semiconductor Index. As a result, the Underlying Leveraged ETF may be subject to greater market fluctuations than a fund that is more broadly invested across industries. As of September 30, 2026, the NYSE Semiconductor Index was comprised of 30 constituents which had a median market capitalization of $74.3 billion and capitalizations ranging from $12.5 billion to $5.4 trillion and were concentrated in the semiconductor industry, which is included in the information technology sector with exposure to companies involved in artificial intelligence and big data. The NYSE Semiconductor Index is rebalanced quarterly and reconstituted annually.

Indirect Investments in the Underlying Leveraged ETF. The Underlying Leveraged ETF is not affiliated with the Trust, the Fund, the Adviser, or their respective affiliates and is not involved with the offering of the Fund in any way and has no obligation to consider your Shares in taking any corporate action that might affect the value of Shares. Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Passive Investment and Underlying Index Performance Risk. Investment in the Fund should be made with the understanding that the passive Underlying Leveraged ETF in which the Fund invests will not be able to replicate exactly the performance of the indices they track because the total return generated by the securities will be reduced by transaction costs incurred in adjusting the actual balance of the securities. In addition, the passive Underlying Leveraged ETF in which the Fund invests will incur expenses not incurred by their applicable indices. Certain securities comprising the indices tracked by the passive Underlying Leveraged ETF may, from time to time, temporarily be unavailable, which may further impede the passive Underlying Leveraged ETF's ability to track their applicable indices.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. that generate specific risks.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given month. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with limited operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so. U.S. trade disputes or other disputes with specific countries that could result in additional tariffs, trade barriers and/or investment restrictions in certain securities in those countries.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of options it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in options were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: The Fund has not yet completed a full calendar year as of the date of this prospectus and therefore does not have a performance history for a full calendar year. Once available, the Fund's performance information will be accessible on the Fund's website at www.graniteshares.com and will provide some indication of the risks of investing in the Fund by showing changes in the Fund's performance and by showing how the Fund's returns compare with those of a broad measure of market performance. The Fund's past performance (before and after taxes) is not necessarily an indication of how the Fund will perform in the future.

Portfolio Managers: Jeff Klearman and Ryan Dofflemeyer have been portfolio managers of the Fund since the Fund's inception. Jeroen Visser has been portfolio manager of the Fund since September 2026.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST SMALL CAP ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 3 times (300%) the income generated from selling options on the Russell 2000® Index (the "Underlying Index") by selling options on leveraged exchange-traded funds designed to deliver 3 times (300%) the daily performance of the Underlying Index (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses **(expenses that you pay each year as a percentage of the value of your investment)**	
Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.

(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.

(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 3 times the daily performance of the Underlying Index. It is expected that the implied volatility on the Underlying Leveraged ETF to be three times the level of the Underlying Index's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, three times the premium generated by selling options on the Underlying Index. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Index.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be three times the losses compared to the Underlying Index. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of that Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or that the Fund will pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Options Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Index directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF, Direxion Daily Small Cap Bull 3X Shares, is a passively managed fund that seeks daily investment results, before fees and expenses, of 300% of the performance of the Russell 2000® index (the "Underlying Index").

The Underlying Index measures the performance of approximately 2,000 small-capitalization companies in the Russell 3000® Index, based on a combination of their market capitalization and current index membership. The Underlying Index is reconstituted annually and enhanced by initial public offerings quarterly.

The Underlying Leveraged ETF may invest in the securities of the Underlying Index, a representative sample of the securities in the Underlying Index that has aggregate characteristics similar to those of the Underlying Index, an ETF that tracks the Underlying Index or a substantially similar index, and may utilize derivatives, such as swaps or futures on the Underlying Index or on an ETF that tracks the same Underlying Index or a substantially similar index, that provide leveraged exposure to the above.

Investors can access information about the Underlying Leveraged ETF, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-150525 and 811-22201. This information, derived from the Underlying Leveraged ETF's filings with the SEC, is essential for investors to understand the Underlying Leveraged ETF's operations, investment strategy, and financial prospects. The description of the Underlying Leveraged ETF's principal investment strategies as outlined here is directly sourced from its prospectus.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with the offering of the securities, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to the Underlying Leveraged ETF. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding the Underlying Leveraged ETF is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of the Underlying Leveraged ETF.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH DIREXION SHARES TRUST ETF, THE UNDERLYING LEVERAGED ETF, RAFFERTY ASSET MANAGEMENT, LLC OR FRANK RUSSELL COMPANY.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 300% of the Underlying Index's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Index during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Index will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 3% for every 1% daily decline in the Underlying Index, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Index decline of more than 33%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Industry Concentration Risk — The Russell 2000® Index may have a significant portion of its value in issuers in an industry or group of industries. The Underlying Leveraged ETF will allocate its investments to approximately the same extent as the Russell 2000® Index. As a result, the Underlying Leveraged ETF may be subject to greater market fluctuations than a fund that is more broadly invested across industries. As of September 30, 2026, the Russell 2000® Index consisted of 1,974 holdings, which had a median market capitalization of $1.1 billion, total market capitalizations ranging from $340 million to $12.6 billion and were concentrated in the healthcare, and industrials sectors. The Russell 2000® Index is reconstituted annually and enhanced by initial public offerings quarterly.

Indirect Investments in the Underlying Leveraged ETF. The Underlying Leveraged ETF is not affiliated with the Trust, the Fund, the Adviser, or their respective affiliates and is not involved with the offering of the Fund in any way and has no obligation to consider your Shares in taking any corporate action that might affect the value of Shares. Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Passive Investment and Underlying Index Performance Risk. Investment in the Fund should be made with the understanding that the passive Underlying Leveraged ETF in which the Fund invests will not be able to replicate exactly the performance of the indices they track because the total return generated by the securities will be reduced by transaction costs incurred in adjusting the actual balance of the securities. In addition, the passive Underlying Leveraged ETF in which the Fund invests will incur expenses not incurred by their applicable indices. Certain securities comprising the indices tracked by the passive Underlying Leveraged ETF may, from time to time, temporarily be unavailable, which may further impede the passive Underlying Leveraged ETF's ability to track their applicable indices.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. that generate specific risks.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given month. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of options it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in options were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST SMCI ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Super Micro Computer Inc.'s common stock (NASDAQ: SMCI) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.53%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.55%
Fee Waiver/Reimbursements/Fees Paid Indirectly [(3), (4)]	-0.37%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements/Fees Paid Indirectly [(1), (2), (3), (4)]	1.18%

(1) Other Expenses are based on actual amounts incurred during the Fund's fiscal period ended June 30, 2026.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's fiscal year ending June 30, 2027.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.
(4) The Funds' have a fee arrangement with its custodian which provides for custody fees to be reduced by Create/Redeem credits received by the custodian from Authorized Participants.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years	5 Years	10 Years
$ 120	$ 453	$ 840	$ 1,814

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it, directly or indirectly through a subsidiary, buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in annual fund operating expenses or in the Example, affect the Fund's performance. During the most recent fiscal year, the Fund's portfolio turnover rate was 0% of the average value of its portfolio, since the Fund invested only in instruments that are excluded from portfolio turnover rate calculations. However, if the Fund's use of derivatives were reflected, the Fund's portfolio turnover rate would be higher.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 3: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Defiance Daily Target 2X Long SMCI ETF (NASDAQ: SMCX). Investors can access information about SMCX, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-264478 and 811-23793. This information, derived from SMCX's filings with the SEC, is essential for investors to understand SMCX's operations, investment strategy, and financial prospects. The description of SMCX's principal investment strategies as outlined here is directly sourced from its prospectus.
(3) GraniteShares 2x Long SMCI Daily ETF (NASDAQ: SMCL). Investors can access information about SMCL, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-214796 and 811-2314. This information, derived from SMCL's filings with the SEC, is essential for investors to understand SMCL's operations, investment strategy, and financial prospects. The description of SMCL's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying SMCL ETF as market and liquidity develop.

Due to the Underlying SMCL ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the computer software industry.

This document relates only to the securities offered hereby and does not relate to the Underlying SMCL ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying SMCL ETF from publicly available documents. SMCL is affiliated with the Fund and both funds are issued under GraniteShares ETF Trust. The Trust and the Adviser have been directly involved in the preparation of the disclosure of SMCL's publicly available documents. In connection to SMCX, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representations that such publicly available documents or any other publicly available information regarding SMCX is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of SMCX.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH SMCX, ITS TRUSTS, AND ITS SERVICE PROVIDERS.

THE FUND, TRUST AND ADVISER ARE AFFILIATED WITH SMCL.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the software and information technology industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock performance may be affected by significant customer losses, its inability to develop and implement new technologies, its reliance on third-party distributors and platforms, cybersecurity attacks, its inability to protect its intellectual property rights and global laws and regulations affecting privacy, data protection and technology protections. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying SMCI PLTR ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with limited operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: The Fund has not yet completed a full calendar year as of the date of this prospectus and therefore does not have a performance history for a full calendar year. Once available, the Fund's performance information will be accessible on the Fund's website at www.graniteshares.com and will provide some indication of the risks of investing in the Fund by showing changes in the Fund's performance and by showing how the Fund's returns compare with those of a broad measure of market performance. The Fund's past performance (before and after taxes) is not necessarily an indication of how the Fund will perform in the future.

Portfolio Managers: Jeff Klearman and Ryan Dofflemeyer have been portfolio managers of the Fund since the Fund's inception. Jeroen Visser has been portfolio manager of the Fund since September 2026.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST SMR ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on NuScale Power Corporation's common stock (NYSE: SMR) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) T-REX 2X Long SMR Daily Target ETF (Cboe BZX Exchange: SMUP). Investors can access information about SMUP, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-234544 and 811-23439. This information, derived from SMUP's filings with the SEC, is essential for investors to understand SMUP's operations, investment strategy, and financial prospects. The description of SMUP's principal investment strategies as outlined here is directly sourced from its prospectus.
(1) Tradr 2X Long SMR Daily ETF (NASDAQ: SMU). Investors can access information about SMU, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-191476 and 811-22894. This information, derived from SMU's filings with the SEC, is essential for investors to understand SMU's operations, investment strategy, and financial prospects. The description of SMU's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the industrials sector and electrical equipment industries.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with SMU and SMUP none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding SMU and SMUP is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of SMU or SMUP.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH SMU OR SMUP, THEIR TRUSTS, AND THEIR SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk — The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of industrials sector and electrical equipment industries. The electrical equipment industry can be significantly affected by general economic trends, including employment, economic growth, interest rates, and changes in commodity prices. Electrical equipment companies are subject to the risks of technical obsolescence, and their profitability may be affected by government regulation and spending, import controls and worldwide competition. Companies in these industries also can be adversely affected by liability for environmental damage, depletion of resources, and mandated expenditures for safety and pollution control. These factors may result in a material adverse impact on the Fund's portfolio securities and the performance of the Fund The electrical equipment industry can be significantly affected by general economic trends, including employment, economic growth, interest rates, and changes in commodity prices. Electrical equipment companies are subject to the risks of technical obsolescence, and their profitability may be affected by government regulation and spending, import controls and worldwide competition. Companies in these industries also can be adversely affected by liability for environmental damage, depletion of resources, and mandated expenditures for safety and pollution control. These factors may result in a material adverse impact on the Fund's portfolio securities and the performance of the Fund. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF. Unaffiliated Underlying Leveraged ETF do not pay fee to the Adviser.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST SOFI ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on SoFi Technologies, Inc.'s common stock (NASDAQ: SOFI) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Defiance Daily Target 2X Long SOFI ETF (NASDAQ: SOFX). Investors can access information about SOFX, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-264478 and 811-23793. This information, derived from SOFX's filings with the SEC, is essential for investors to understand SOFX's operations, investment strategy, and financial prospects. The description of SOFX's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the consumer finance industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection to SOFX, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding SOFX is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of SOFX.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH SOFX, ITS TRUSTS, AND ITS SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the consumer finance industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but are not limited to changes in economic conditions, demand for consumer loans, and refinancing activity. Profitability can be largely dependent on the availability and cost of capital and the rate of consumer debt defaults, and can fluctuate significantly when interest rates change. Financial difficulties of borrowers can negatively affect the consumer finance industry. Companies in the consumer finance industry are subject to extensive government regulation, which can change frequently and may adversely affect the scope of their activities, the prices they can charge and the amount of capital they must maintain, or may affect them in other ways that are unforeseeable. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST SOUN ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on SoundHound AI, Inc.'s common stock (NASDAQ: SOUN) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Defiance Daily Target 2X Long SOUN ETF (NASDAQ: SOUX). Investors can access information about SOUX, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-264478 and 811-23793. This information, derived from SOUX's filings with the SEC, is essential for investors to understand SOUX's operations, investment strategy, and financial prospects. The description of SOUX's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the software and information technology industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection to SOUX, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to the fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding SOUX is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of SOUX.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH SOUX, THEIR TRUSTS, AND THEIR SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the software and information technology industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock performance may be affected by significant customer losses, its inability to develop and implement new technologies, its reliance on third-party distributors and platforms, cybersecurity attacks, its inability to protect its intellectual property rights and global laws and regulations affecting privacy, data protection and technology protections. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF. Unaffiliated Underlying Leveraged ETF do not pay fee to the Adviser.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST SPY ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 3 times (300%) the income generated from selling options on the S&P 500® Index (the "Underlying Index") by selling options on leveraged exchange-traded funds designed to deliver 3 times (300%) the daily performance of the Underlying Index (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below**.

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [1]	0.30%
Recoupment of previously waived expenses	0.00%
Acquired Fund Fees and Expenses [2]	0.03%
Total Annual Fund Operating Expenses	1.32%
Fee Waiver/Reimbursements/Fees Paid Indirectly [3], [4]	-0.14%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements/Fees Paid Indirectly [1], [2], [3], [4]	1.18%

(1) Other Expenses are based on actual amounts incurred during the Fund's fiscal period ended June 30, 2026.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's fiscal year ending June 30, 2027.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.
(4) The Funds' have a fee arrangement with its custodian which provides for custody fees to be reduced by Create/Redeem credits received by the custodian from Authorized Participants.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years	5 Years	10 Years
$ 120	$ 405	$ 710	$ 1,578

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it, directly or indirectly through a subsidiary, buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in annual fund operating expenses or in the Example, affect the Fund's performance. During the most recent fiscal year, the Fund's portfolio turnover rate was 0% of the average value of its portfolio, since the Fund invested only in instruments that are excluded from portfolio turnover rate calculations. However, if the Fund's use of derivatives were reflected, the Fund's portfolio turnover rate would be higher.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 3 times the daily performance of the Underlying Index. It is expected that the implied volatility on the Underlying Leveraged ETF to be three times the level of the Underlying Index's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, three times the premium generated by selling options on the Underlying Index. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Index.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be three times the losses compared to the Underlying Index. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or that the Fund will pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Options Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Index directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 3, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF, Direxion Daily S&P500® Bull 3X Shares, is a passively managed fund that seeks daily investment results, before fees and expenses, of 300% of the performance of the S&P 500® index (the "Underlying Index").

The Underlying Index is designed to be comprised of stocks that are the 500 leading, large-cap U.S.-listed issuers. It selects constituents on the basis of market capitalization, financial viability of the company, sector representation, public float, liquidity and price of a company's shares outstanding. The Underlying Index is a float-adjusted and market capitalization-weighted index.

The Underlying Leveraged ETF may invest in the securities of the Underlying Index, a representative sample of the securities in the Underlying Index that has aggregate characteristics similar to those of the Underlying Index, an ETF that tracks the Underlying Index or a substantially similar index, and may utilize derivatives, such as swaps or futures on the Underlying Index or on an ETF that tracks the same Underlying Index or a substantially similar index, that provide leveraged exposure to the above.

Investors can access information about the Underlying Leveraged ETF, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-150525 and 811-22201. This information, derived from the Underlying Leveraged ETF's filings with the SEC, is essential for investors to understand the Underlying Leveraged ETF's operations, investment strategy, and financial prospects. The description of the Underlying Leveraged ETF's principal investment strategies as outlined here is directly sourced from its prospectus.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with the offering of the securities, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to the Underlying Leveraged ETF. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding the Underlying Leveraged ETF is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of the Underlying Leveraged ETF.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH DIREXION SHARES TRUST ETF, THE UNDERLYING LEVERAGED ETF, RAFFERTY ASSET MANAGEMENT, LLC OR S&P DOW JONES INDICES LLC.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 300% of the Underlying Index's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Index during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Index will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 3% for every 1% daily decline in the Underlying Index, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Index decline of more than 33%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Industry Concentration Risk — The S&P 500® index may have a significant portion of its value in issuers in an industry or group of industries. The Underlying Leveraged ETF will allocate its investments to approximately the same extent as the S&P 500® index. As a result, the Underlying Leveraged ETF may be subject to greater market fluctuations than a fund that is more broadly invested across industries. As of September 30, 2026, the S&P 500® index consisted of 503 constituents, which had an average market capitalization of $136.1 billion, total market capitalizations ranging from $4.2 billion to $4.3 trillion and were concentrated in the information technology sector. The S&P 500® index is rebalanced quarterly.

Indirect Investments in the Underlying Leveraged ETF. The Underlying Leveraged ETF is not affiliated with the Trust, the Fund, the Adviser, or their respective affiliates and is not involved with the offering of the Fund in any way and has no obligation to consider your Shares in taking any corporate action that might affect the value of Shares. Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Passive Investment and Underlying Index Performance Risk. Investment in the Fund should be made with the understanding that the passive Underlying Leveraged ETF in which the Fund invests will not be able to replicate exactly the performance of the indices they track because the total return generated by the securities will be reduced by transaction costs incurred in adjusting the actual balance of the securities. In addition, the passive Underlying Leveraged ETF in which the Fund invests will incur expenses not incurred by their applicable indices. Certain securities comprising the indices tracked by the passive Underlying Leveraged ETF may, from time to time, temporarily be unavailable, which may further impede the passive Underlying Leveraged ETF's ability to track their applicable indices.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. that generate specific risks.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given month. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with limited operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so. U.S. trade disputes or other disputes with specific countries that could result in additional tariffs, trade barriers and/or investment restrictions in certain securities in those countries.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of options it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in options were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet completed a full calendar year of investment operations, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman and Ryan Dofflemeyer have been portfolio managers of the Fund since the Fund's inception. Jeroen Visser has been portfolio manager of the Fund since September 2026.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST TECHNOLOGY ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 3 times (300%) the income generated from selling options on the Technology Select Sector Index (the "Underlying Index") by selling options on leveraged exchange-traded funds designed to deliver 3 times (300%) the daily performance of the Underlying Index (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	13.68%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	14.70%
Fee Waiver/Reimbursements [(3)]	-13.52%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.18%

(1) Other Expenses are based on actual amounts incurred during the Fund's fiscal period ended June 30, 2026.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's fiscal year ending June 30, 2027.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years	5 Years	10 Years
$ 120	$ 2,884	$ 5,137	$ 9,115

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it, directly or indirectly through a subsidiary, buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in annual fund operating expenses or in the Example, affect the Fund's performance. During the most recent fiscal year, the Fund's portfolio turnover rate was 0% of the average value of its portfolio, since the Fund invested only in instruments that are excluded from portfolio turnover rate calculations. However, if the Fund's use of derivatives were reflected, the Fund's portfolio turnover rate would be higher.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 3 times the daily performance of the Underlying Index. It is expected that the implied volatility on the Underlying Leveraged ETF to be three times the level of the Underlying Index's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, three times the premium generated by selling options on the Underlying Index. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Index.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be three times the losses compared to the Underlying Index. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or that the Fund will pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF.

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Index directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may sell Flexible Exchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

Underlying Leveraged ETF

The Underlying Leveraged ETF, Direxion Daily Technology Bull 3X Shares, is a passively managed fund that seeks daily investment results, before fees and expenses, of 300% of the performance of the Technology Select Sector Index (the "Underlying Index").

The Underlying Index is a product of S&P Dow Jones Indices LLC ("SPDJI") (the "Index Provider") and includes domestic companies from the technology sector which includes the following industries: information technology hardware, storage, and peripherals; software; communications equipment; semiconductors and semiconductor equipment; IT services; and electrical equipment, instruments and components. The Underlying Index is one of eleven Select Sector Indexes developed and maintained in accordance with the following criteria: (1) each of the stocks in the Underlying Index is also a constituent company of the S&P 500® Index; (2) each constituent in the S&P 500® Index is assigned to one of the Select Sector Indexes; and (3) the Underlying Index is calculated by the Index Provider using a modified "market capitalization" methodology, which is a hybrid between equal weighting and conventional market capitalization weighting with the weighting capped for the largest stocks included in the Underlying Index. This design ensures that each of the component stocks within a Select Sector Index is represented proportionate to the total market capitalization of such Select Sector Index.

The Underlying Leveraged ETF may invest in the securities of the Underlying Index, a representative sample of the securities in the Underlying Index that has aggregate characteristics similar to those of the Underlying Index, an ETF that tracks the Underlying Index or a substantially similar index, and may utilize derivatives, such as swaps or futures on the Underlying Index or on an ETF that tracks the same Underlying Index or a substantially similar index, that provide leveraged exposure to the above.

Investors can access information about the Underlying Leveraged ETF, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-150525 and 811-22201. This information, derived from the Underlying Leveraged ETF's filings with the SEC, is essential for investors to understand the Underlying Leveraged ETF's operations, investment strategy, and financial prospects. The description of the Underlying Leveraged ETF's principal investment strategies as outlined here is directly sourced from its prospectus.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with the offering of the securities, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to the Underlying Leveraged ETF. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding the Underlying Leveraged ETF is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of the Underlying Leveraged ETF.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH DIREXION SHARES TRUST ETF, THE UNDERLYING LEVERAGED ETF, RAFFERTY ASSET MANAGEMENT, LLC OR S&P DOW JONES INDICES, LLC.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 300% of the Underlying Index's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Index during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Index will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 3% for every 1% daily decline in the Underlying Index, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Index decline of more than 33%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Industry Concentration Risk — The Technology Select Sector Index may have a significant portion of its value in issuers in an industry or group of industries. The Underlying Leveraged ETF will allocate its investments to approximately the same extent as the Technology Select Sector Index. As a result, the Underlying Leveraged ETF may be subject to greater market fluctuations than a fund that is more broadly invested across industries. As of September 30, 2026, the Technology Select Sector Index was comprised of 84 constituents with a median market capitalization of $77.0 billion, total market capitalizations ranging from $11.9 billion to $5.2 trillion and were concentrated in the information technology sector. The Technology Select Sector Index is rebalanced quarterly.

Indirect Investments in the Underlying Leveraged ETF. The Underlying Leveraged ETF is not affiliated with the Trust, the Fund, the Adviser, or their respective affiliates and is not involved with the offering of the Fund in any way and has no obligation to consider your Shares in taking any corporate action that might affect the value of Shares. Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Passive Investment and Underlying Index Performance Risk. Investment in the Fund should be made with the understanding that the passive Underlying Leveraged ETF in which the Fund invests will not be able to replicate exactly the performance of the indices they track because the total return generated by the securities will be reduced by transaction costs incurred in adjusting the actual balance of the securities. In addition, the passive Underlying Leveraged ETF in which the Fund invests will incur expenses not incurred by their applicable indices. Certain securities comprising the indices tracked by the passive Underlying Leveraged ETF may, from time to time, temporarily be unavailable, which may further impede the passive Underlying Leveraged ETF's ability to track their applicable indices.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. that generate specific risks.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given month. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with limited operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so. U.S. trade disputes or other disputes with specific countries that could result in additional tariffs, trade barriers and/or investment restrictions in certain securities in those countries.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: The Fund has not yet completed a full calendar year as of the date of this prospectus and therefore does not have a performance history for a full calendar year. Once available, the Fund's performance information will be accessible on the Fund's website at www.graniteshares.com and will provide some indication of the risks of investing in the Fund by showing changes in the Fund's performance and by showing how the Fund's returns compare with those of a broad measure of market performance. The Fund's past performance (before and after taxes) is not necessarily an indication of how the Fund will perform in the future.

Portfolio Managers: Jeff Klearman and Ryan Dofflemeyer have been portfolio managers of the Fund since the Fund's inception. Jeroen Visser has been portfolio manager of the Fund since September 2026.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST TEM ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Tempus AI, Inc.'s common stock (NASDAQ: TEM) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1-month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1-month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 3: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Tradr 2X Long TEM Daily ETF (NASDAQ: TEMT). Investors can access information about TEMT, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-191476 and 811-22894. This information, derived from TEMT's filings with the SEC, is essential for investors to understand TEMT's operations, investment strategy, and financial prospects. The description of TEMT's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the information technology and computer programming industries.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection to TEMT, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to the fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding TEMT is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of TEMT.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH TEMT, ITS TRUSTS, AND ITS SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the information technology and computer programming industries. The information technology industry includes companies engaged in internet software and services, technology hardware and storage peripherals, electronic equipment instruments and components, and semiconductors and semiconductor equipment. Information technology companies face intense competition, both domestically and internationally, which may have an adverse effect on profit margins. Information technology companies may have limited product lines, markets, financial resources or personnel. The products of information technology companies may face rapid product obsolescence due to technological developments and frequent new product introduction, unpredictable changes in growth rates and competition for the services of qualified personnel. Failure to introduce new products, develop and maintain a loyal customer base, or achieve general market acceptance for their products could have a material adverse effect on a company's business. Companies in the information technology sector are heavily dependent on intellectual property, and the loss of patent, copyright and trademark protections may adversely affect the profitability of these companies. Companies in the computer programming industry provide social networking, file sharing, and other web-based media applications. The risks related to investing in such companies include disruption in service caused by hardware or software failure, interruptions or delays in service by third-party data center hosting facilities and maintenance providers, security breaches involving certain private, sensitive, proprietary and confidential information managed and transmitted by social media companies, and privacy concerns and laws, evolving Internet regulation and other foreign or domestic regulations that may limit or otherwise affect the operations of such companies. Additionally, the collection of data from consumers and other sources could face increased scrutiny as regulators consider how the data is collected, stored, safeguarded and used. Furthermore, the business models employed by the companies are in the computer programming industries. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF. Unaffiliated Underlying Leveraged ETF do not pay fee to the Adviser.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST TSLA ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Tesla Inc.'s common stock (NASDAQ: TSLA) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.09%
Recoupment of previously waived expenses	0.02%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.13%
Fee Waiver/Reimbursements/Fees Paid Indirectly [(3), (4)]	-0.02%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements/Fees Paid Indirectly [(1), (2), (3), (4)]	1.11%

(1) Other Expenses are based on actual amounts incurred during the Fund's fiscal period ended June 30, 2026.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's fiscal year ending June 30, 2027.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.
(4) The Funds' have a fee arrangement with its custodian which provides for custody fees to be reduced by Create/Redeem credits received by the custodian from Authorized Participants.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years	5 Years	10 Years
$ 113	$ 357	$ 620	$ 1,373

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it, directly or indirectly through a subsidiary, buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in annual fund operating expenses or in the Example, affect the Fund's performance. During the most recent fiscal year, the Fund's portfolio turnover rate was 0% of the average value of its portfolio, since the Fund invested only in instruments that are excluded from portfolio turnover rate calculations. However, if the Fund's use of derivatives were reflected, the Fund's portfolio turnover rate would be higher.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be 2 times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or that the Fund will pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to reference the following products as Underlying Leveraged ETF:

(1) Direxion Daily TSLA Bull 2X Shares (NASDAQ: TSLL). Investors can access information about TSLL, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-150525 and 811-22201. This information, derived from TSLL's filings with the SEC, is essential for investors to understand TSLL's operations, investment strategy, and financial prospects. The description of TSLL's principal investment strategies as outlined here is directly sourced from its prospectus.
(2) REX 2X Long Tesla Daily Target ETF (NASDAQ: TSLT). Investors can access information about TSLT, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-23444 and 811-23439. This information, derived from TSLT's filings with the SEC, is essential for investors to understand TSLT's operations, investment strategy, and financial prospects. The description of TSLT's principal investment strategies as outlined here is directly sourced from its prospectus.
(3) Leverage Shares 2x Long TSLA Daily ETF (NASDAQ: TSLG). Investors can access information about TSLG, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-271700 and 811-23872. This information, derived from TSLG's filings with the SEC, is essential for investors to understand TSLG's operations, investment strategy, and financial prospects. The description of TSLG's principal investment strategies as outlined here is directly sourced from its prospectus.
(4) GraniteShares 2x Long TSLA Daily ETF (NASDAQ: TSLR). Investors can access information about TSLR, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-214796 and 811-2314. This information, derived from TSLR's filings with the SEC, is essential for investors to understand TSLR's operations, investment strategy, and financial prospects. The description of TSLR's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the automotive industry.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH TSLL, TSLT AND TSLG, THEIR TRUSTS, AND THEIR SERVICE PROVIDERS.

THE FUND, TRUST AND ADVISER ARE AFFILIATED WITH TSLR.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Industry Concentration Risk — The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to risks of the automotive industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk and the risk of natural disasters. The Underlying Stock performance may be affected by the company's ability to develop and launch new products, the growth of its sales and delivery capabilities, part supplier constraints or delays, consumer demand for electric vehicles and competition from existing and new competitors. Governmental policies affecting the automotive industry, such as taxes, tariffs, duties, subsidies, and import and export restrictions on automotive products can influence industry profitability. In addition, such companies must comply with environmental laws and regulations, for which there may be severe consequences for non-compliance. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. that generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given month. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so. U.S. trade disputes or other disputes with specific countries that could result in additional tariffs, trade barriers and/or investment restrictions in certain securities in those countries.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

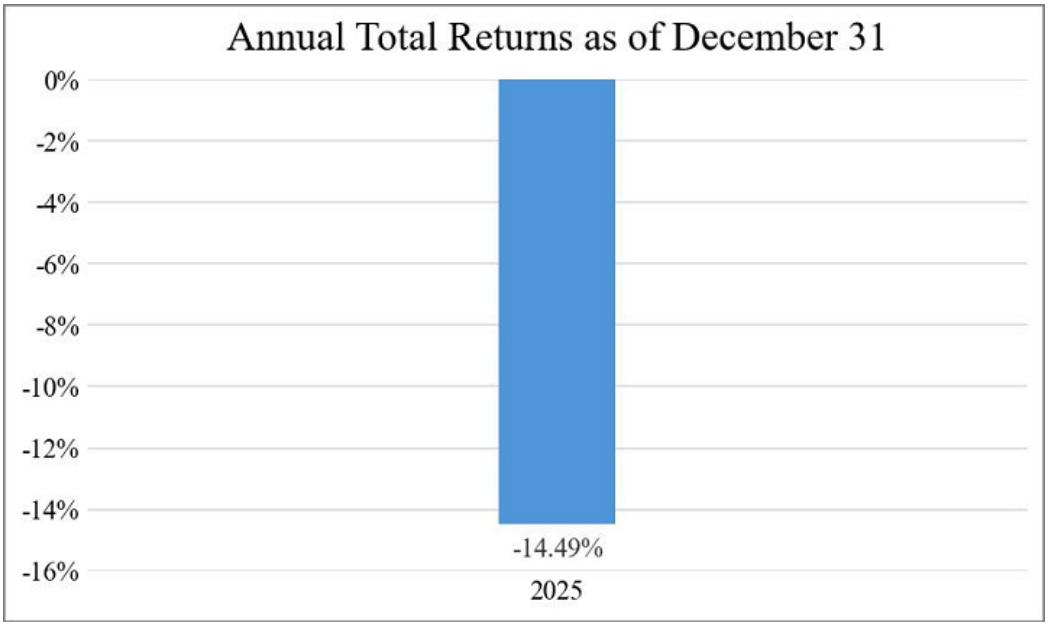
Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.



Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance:

The following performance information indicates some of the risks of investing in the Fund. The bar chart shows the Fund's performance for the calendar year ended December 31, 2025. The table illustrates how the Fund's average annual returns for the 1-year and since inception periods compare with those of a broad measure of market performance. The Fund's past performance, before and after taxes, does not necessarily indicate how it will perform in the future. Updated performance information is also available on the Fund's website at www.graniteshares.com or by calling the Fund toll free at 844-476-8747.

During the periods shown in the bar chart above, the Fund's highest quarterly return was 19.43% (quarter ended September 30, 2025) and the Fund's lowest quarterly return was -26.29% (quarter ended March 31, 2025). The calendar year-to-date total return of the Fund as of September 30, 2026, was -20.19%.

Average Annual Total Returns for the Periods Ended December 31, 2025

	1 Year	Since Inception (12/17/2024)
Return Before Taxes	(14.49)%	(17.26)%
Return After Taxes on Distributions	(38.78)%	(40.07)%
Return After Taxes on Distributions and Sale of Fund Shares	(9.06)%	(18.92)%
S&P 500 Total Return Index (reflects no deduction for fees, expenses or taxes)	17.88%	14.06%

Portfolio Managers: Jeff Klearman and Ryan Dofflemeyer have been portfolio managers of the Fund since the Fund's inception. Jeroen Visser has been portfolio manager of the Fund since September 2026.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST TSM ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Taiwan Semiconductor Manufacturing Co Ltd's ADR (NYSE: TSM) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	8.21%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	9.23%
Fee Waiver/Reimbursements [(3)]	-8.05%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.18%

(1) Other Expenses are based on actual amounts incurred during the Fund's fiscal period ended June 30, 2026.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's fiscal year ending June 30, 2027.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years	5 Years	10 Years
$ 120	$ 1,957	$ 3,641	$ 7,266

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it, directly or indirectly through a subsidiary, buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in annual fund operating expenses or in the Example, affect the Fund's performance. During the most recent fiscal year, the Fund's portfolio turnover rate was 0% of the average value of its portfolio, since the Fund invested only in instruments that are excluded from portfolio turnover rate calculations. However, if the Fund's use of derivatives were reflected, the Fund's portfolio turnover rate would be higher.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Defiance Daily Target 2X Long TSM ETF (NASDAQ: TSMG). Investors can access information about TSMG, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-264478 and 811-23793. This information, derived from TSMG's filings with the SEC, is essential for investors to understand TSMG's operations, investment strategy, and financial prospects. The description of TSMG's principal investment strategies as outlined here is directly sourced from its prospectus.
(2) Direxion Daily TSM Bull 2X Shares (NASDAQ: TSMX). Investors can access information about TSMX, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-150525 and 811-22201. This information, derived from TSMX's filings with the SEC, is essential for investors to understand TSMX's operations, investment strategy, and financial prospects. The description of TSMX's principal investment strategies as outlined here is directly sourced from its prospectus.
(3) GraniteShares 2x Long TSM Daily ETF (NASDAQ: TSMU). Investors can access information about TSMU, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-214796 and 811-2314. This information, derived from TSMU's filings with the SEC, is essential for investors to understand TSMU's operations, investment strategy, and financial prospects. The description of TSMU's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in semi-conductor industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. The Trust and the Adviser have been directly involved in the preparation of the disclosure of TSMU's publicly available documents. In connection to TSMG or TSMX, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding TSMG or TSMX is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of TSMG or TSMX.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH TSMG OR TSMX, THEIR TRUSTS, AND THEIR SERVICE PROVIDERS.

THE FUND, TRUST AND ADVISER ARE AFFILIATED WITH TSMU.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the semiconductor industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock performance may be affected by global markets and demand for its products and services, its ability to develop new products and services, inventory levels, supply chain issues, the performance of third-party software developers, system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the semiconductor industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. The global recovery from COVID-19 is proceeding at slower than expected rates due to the emergence of variant strains and may last for an extended period of time. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: The Fund has not yet completed a full calendar year as of the date of this prospectus and therefore does not have a performance history for a full calendar year. Once available, the Fund's performance information will be accessible on the Fund's website at www.graniteshares.com and will provide some indication of the risks of investing in the Fund by showing changes in the Fund's performance and by showing how the Fund's returns compare with those of a broad measure of market performance. The Fund's past performance (before and after taxes) is not necessarily an indication of how the Fund will perform in the future.

Portfolio Managers: Jeff Klearman and Ryan Dofflemeyer have been portfolio managers of the Fund since the Fund's inception. Jeroen Visser has been portfolio manager of the Fund since September 2026.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST UBER ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Uber Technologies, Inc.'s common stock (NASDAQ: UBER) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.

(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.

(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 3: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(3) GraniteShares 2x Long UBER Daily ETF (NASDAQ: UBRL). Investors can access information about UBRL, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-214796 and 811-2314. This information, derived from UBRL's filings with the SEC, is essential for investors to understand UBRL's operations, investment strategy, and financial prospects. The description of UBRL's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the business services industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. The Trust and the Adviser have been directly involved in the preparation of the disclosure of UBRL's publicly available documents. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

THE FUND, TRUST AND ADVISER ARE AFFILIATED WITH UBRL.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the business services industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock performance may be affected by the company's ability to attract and maintain a certain level of drivers and consumers, its success in investing in new technologies and services, the potential classification of its drivers as employees, changes in the conditions affecting major markets, cyberattacks, its ability to receive additional working capital, governmental regulation changes and risks of legal proceeding. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST UNH ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on UnitedHealth Group Incorporated's common stock (NYSE: UNH) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.

(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.

(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Leverage Shares 2X Long UNH ETF (NASDAQ: UNHG). Investors can access information about UNHG, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-271700 and 811-23872. This information, derived from UNHG's filings with the SEC, is essential for investors to understand UNHG's operations, investment strategy, and financial prospects. The description of UNHG's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the healthcare industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with UNHG, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to the fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding UNHG is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of UNHG.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH UNHG, ITS TRUSTS, AND ITS SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the healthcare industry. The profitability of companies in the healthcare industry may be affected by extensive, costly and uncertain government regulation, restrictions on government reimbursement for medical expenses, rising costs of medical products and services, pricing pressure (including price discounting), changes in the demand for medical products and services, an increased emphasis on outpatient services, limited product lines, industry innovation and/or consolidation, changes in technologies and other market developments. Many healthcare companies are heavily dependent on obtaining and defending patents, which may be time consuming and costly. The expiration of patents may adversely affect the profitability of these companies. Many healthcare companies are subject to extensive litigation based on product liability and similar claims. In addition, their products can become obsolete due to industry innovation, changes in technologies or other market developments. Many new products in the health care sector require significant research and development and may be subject to regulatory approvals, all of which may be time-consuming and costly with no guarantee that any product will come to market. These companies may be adversely affected by government regulation and changes in reimbursement rates from third-party payors, such as Medicare, Medicaid and other government-sponsored programs, private health insurance plans and health maintenance organizations. The profitability of these companies may be dependent on a relatively limited number of products. Additionally, their products can become obsolete due to industry innovation, changes in technologies or other market developments. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfil these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF. Unaffiliated Underlying Leveraged ETF do not pay fee to the Adviser.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST UPST ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Upstart Holdings, Inc.'s common stock (NASDAQ: UPST) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Tradr 2X Long UPST Daily ETF (NASDAQ: UPSX). Investors can access information about UPSX, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-191476 and 811-22894. This information, derived from UPSX's filings with the SEC, is essential for investors to understand UPSX's operations, investment strategy, and financial prospects. The description of UPSX's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in financial services industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with UPSX none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to the fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding UPSX is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of UPSX.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH UPSX, THEIR TRUSTS, AND THEIR SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the financial services industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but are not limited to government regulations, economic conditions, credit rating downgrades, changes in interest rates and decreased liquidity in credit markets. Profitability of these companies is largely dependent on the availability and cost of capital and can fluctuate significantly when interest rates change. Credit losses resulting from financial difficulties of borrowers also can negatively impact the sector. These companies are also subject to substantial government regulation and intervention, which may adversely impact the scope of their activities, the prices they can charge, the amount of capital they must maintain, and potentially, their size. The Underlying Stock performance may be affected by system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the financial services sector and the insurance industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF. Unaffiliated Underlying Leveraged ETF do not pay fee to the Adviser.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST VRT ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Vertiv Holdings Co.'s common stock (NYSE: VRT) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [(1)]	0.08%
Acquired Fund Fees and Expenses [(2)]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [(3)]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [(1), (2), (3)]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has been adopted as a fundamental investment policy and therefore each Fund's investment objective along with its respective 80% investment policy may be changed without the consent of that Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) GraniteShares 2x Long VRT Daily ETF (NASDAQ: VRTL). Investors can access information about VRTL, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-214796 and 811-2314. This information, derived from VRTL's filings with the SEC, is essential for investors to understand VRTL's operations, investment strategy, and financial prospects. The description of VRTL's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the industrial machinery industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. The Trust and the Adviser have been directly involved in the preparation of the disclosure of VRTL's publicly available documents. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

THE FUND, TRUST AND ADVISER ARE AFFILIATED WITH VRTL.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the industrial machinery industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but are not limited to the availability and prices of raw materials, components, products and services from third-party suppliers, and such suppliers' ability to timely deliver the quantities and quality required at reasonable prices could have a material adverse effect on our company, its prospects and financial performance. Worldwide economic conditions could have an effect on the demand for our company's services and products and could result in declining revenue and earnings. General economic declines or a softening of the economy make it more likely that our company may experience difficulties collecting accounts receivable, sales and demand for our company's products may decrease, and our company's operating results may be adversely affected. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

GRANITESHARES YIELDBOOST XYZ ETF – SUMMARY

Investment Objective

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Block, Inc.'s common stock (NYSE: XYZ) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

Fund Fees and Expenses

This table describes the fees and expenses that you may pay if you buy, hold, and sell shares of the Fund ("Shares"). The fees are expressed as a percentage of the Fund's average daily net assets. **Investors may pay other fees, such as brokerage commissions and other fees to financial intermediaries, which are not reflected in the table and example below.**

Annual Fund Operating Expenses
(expenses that you pay each year as a percentage of the value of your investment)

Management Fee	0.99%
Distribution and/or Service (12b-1) Fees	0.00%
Other Expenses [1]	0.08%
Acquired Fund Fees and Expenses [2]	0.03%
Total Annual Fund Operating Expenses	1.10%
Fee Waiver/Reimbursements [3]	0.00%
Net Annual Fund Operating Expenses After Fee Waiver/Reimbursements [1], [2], [3]	1.10%

(1) Other Expenses are estimated for the Fund's initial fiscal year.
(2) Acquired Fund Fees and Expenses are the indirect costs of investing in other investment companies. Total Annual Fund Operating Expenses reflect Fund expenses paid indirectly and do not correlate to the expense ratios in the Fund's Financial Highlights because the Financial Highlights include only the direct operating expenses incurred by the Fund and exclude Acquired Fund Fees and Expenses. The amounts are estimated for the Fund's initial fiscal year.
(3) GraniteShares Advisors LLC has contractually agreed to waive its fees and/or pay for operating expenses of the Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the Investment Company Act of 1940, as amended) will not exceed 1.15%. This agreement is effective until December 31, 2027, and it may be terminated before that date only by the Trust's Board of Trustees. GraniteShares Advisors LLC may request recoupment of previously waived fees and paid expenses from the Fund for three years from the date such fees and expenses were waived or paid, if such reimbursement will not cause the Fund's total expense ratio to exceed the expense limitation in place at the time of the waiver and/or expense payment and the expense limitation in place at the time of the recoupment.

Example

This Example is intended to help you compare the cost of investing in the Fund with the cost of investing in mutual funds and other exchange-traded funds.

The Example assumes that you invest $10,000 in the Fund for the time periods indicated and then sell all of your Shares at the end of those periods. The Example also assumes that your investment has a 5% return each year and that the Fund's operating expenses remain the same. The figures shown would be the same whether or not you sold your Shares at the end of each period.

Although your actual costs may be higher or lower, based on these assumptions your costs would be:

1 Year	3 Years
$ 115	$ 377

Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or "turns over" its portfolio). A higher portfolio turnover rate may indicate higher transaction costs and may result in higher taxes when Shares are held in a taxable account. These costs, which are not reflected in the total annual fund operating expenses or in the expense example above, affect the Fund's performance. Because the Fund is newly organized, portfolio turnover information is not yet available.

Principal Investment Strategies

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

For more information, see section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts" below.

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

The Fund is classified as "non-diversified" under the Investment Company Act of 1940, as amended (the "1940 Act").

The Fund will be subject to regulatory constraints relating to the level of value at risk that the Fund may incur through its derivatives portfolio. To the extent the Fund exceeds these regulatory thresholds over an extended period, the Fund may determine that it is necessary to make adjustments to the Fund's investment strategy and the Fund may not achieve its investment objective.

The Fund's investment objective has not been adopted as a fundamental investment policy and therefore the Fund's investment objective along with its respective 80% investment policy may be changed without the consent of the Fund's shareholders upon approval by the Board of Trustees (the "Board") of GraniteShares ETF Trust (the "Trust") and 60 days' written notice to shareholders.

There is no guarantee that the Fund's investment strategy will be properly implemented or pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

An investment in the Fund is not an investment in the Underlying Leveraged ETF

- The Fund's strategy will cap its potential gain to the premium received from selling options on the Underlying Leveraged ETF,
- The Fund's strategy is exposed to all potential losses if the Underlying Leveraged ETF's share declines, subject to a potential downside protection if a Put Spread Strategy is used (as defined in the next section). The potential losses may not be offset by the premium received by the Fund,
- The Fund does not invest directly in the Underlying Leveraged ETF,
- Fund shareholders are not entitled to any distribution paid by the Underlying Leveraged ETF.

Additional information regarding the Underlying Leveraged ETF is set forth below.

The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. A put spread consists of selling a put option contract while buying a put option contract with the same maturity but a lower strike price. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice the level of income that would be obtained by selling options on the Underlying Stock directly. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1-month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1-month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

Example 1 – Put Write Strategy - Selling In-the-money Put Option Contract with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.50 premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.50 premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops to $99.50 before expiration.	The $5.50 premium received is equal to the drop in price in the Underlying Leveraged ETF's share price, resulting in a return of zero.
Case 4: the Underlying Leveraged ETF's share price drops below $99.50, that is the strike price ($105.00) reduced by the premium received ($5.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 2 – Put Write Strategy - Selling Out-of-the-money Put Options Contracts with a One-week Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an out-of-the-money put option contract with a strike price of $95.00 and a one-week maturity. The Fund receives a $0.50 premium for selling the put option contract.

Case 1: the Underlying Leveraged ETF's share price increases above $100.00 before expiration.	The Fund would keep the $0.50 premium received but would not participate in the increased in the Underlying Leveraged ETFs' share price.
Case 2: the Underlying Leveraged ETF's share price drops below $94.50, that is the strike price ($95.00) reduced by the premium received ($0.50).	The Fund would lose money and be exposed to the drop in the Underlying Leveraged ETF's share price.

Example 3 – Put Spread Strategy - Selling At-the-money Put Options Contracts and buy an Out-of-the-money Put Options Contracts with both with a One-month Maturity

Assume for simplicity that the Underlying Leveraged ETF's shares are trading at $100.00 at the time the Fund sells an in-the-money put option contract with a strike price of $105.00 and buy an out-of-the-money put option contract with a strike price of $95.00 both with a one-month maturity. The Fund receives a $5.50 premium for selling the put option contract and pays $0.50 premium for buying the put option contract. Hence the Fund receives a $5.00 net premium.

Case 1: the Underlying Leveraged ETF's share price increases to $105.00 before expiration.	The Fund would keep the $5.00 net premium received.
Case 2: the Underlying Leveraged ETF's share price increase exceeded $105.00 before expiration.	The Fund would keep the $5.00 net premium received but would not participate in any of the additional upside.
Case 3: the Underlying Leveraged ETF's share price drops below $100.00, that is the strike price of the option sold ($105.00) reduced by the net premium received ($5.00) but remains above $95.00 before expiration.	The Fund would lose up to $5.00, which is the difference between the 2 strike levels reduced by the net premium received
Case 4: the Underlying Leveraged ETF's share price drops below $95.00	The Fund would lose $5.00, which is the difference between the 2 strike levels reduced by the net premium received.

The comparison between the Put Write Strategy in Example 1 and the Put Spread Strategy in Example 3, shows that the Put Spread Strategy has a narrower range of outcomes. It has limited participation in a potential increase or decrease in the Underlying Leveraged ETF's share price.

In examples 1 and 2, if the Underlying Leveraged ETF's price were to drop to zero, the Fund's NAV would be equal, before fees and costs, to the value of premium received.

Types of Options Contracts Used by the Fund

As part of the Fund's strategy, the Fund may buy or sell FLexible EXchange® ("FLEX") put options contracts that are based on the value of the price returns of the Underlying Leveraged ETF. The Fund will only buy or sell options contracts that are listed for trading on regulated U.S. exchanges. Traditional exchange-traded options contracts have standardized terms, such as the type (call or put), the reference asset, the strike price and expiration date. Exchange-listed options contracts are guaranteed for settlement by the Options Clearing Corporation ("OCC"). FLEX Options are a type of exchange-listed options contract with uniquely customizable terms that allow investors to customize key terms like type, strike price and expiration date that are standardized in a typical options contract. FLEX Options are also guaranteed for settlement by the OCC.

In general, an option is a contract that gives the purchaser (holder) of the option, in return for a premium, the right to buy from (call) or sell to (put) the seller (writer) of the option the security or currency underlying (in this case, the Underlying Leveraged ETF) the option at a specified exercise price. The writer of an option has the obligation upon exercise of the option to deliver the underlying security or currency upon payment of the exercise price (call) or to pay the exercise price upon delivery of the underlying security or currency (put). An option is said to be "European Style" when it can be exercised only at expiration whereas an "American Style" option can be exercised at any time prior to expiration. The Fund might use either European or American style options. The Fund intends to primarily utilize European style options.

Swap agreements Used by the Fund

As part of the Fund's strategy, the Fund may enter into swap agreements with major financial institutions that provide the same exposure as to buying and/or selling put options contracts on the Underlying Leveraged ETF. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. All put options contracts referenced in a swap agreement will be listed for trading on regulated U.S. exchanges.

The swap performance will settle in cash only irrespective of the types of the put options contracts referenced in the swap agreement.

Underlying Leveraged ETF

The Underlying Leveraged ETF seeks daily leverage investment results of 2 times (200%) the daily percentage of the Underlying Stock by entering into swap agreements on the Underlying Stock. The Underlying Leveraged ETF aims to generate 2 times the daily performance of the Underlying Stock for a single day. A "single day" is defined as being calculated "from the close of regular trading on one trading day to the close on the next trading day."

Because of daily rebalancing and the compounding of each day's return over time, the return of the Underlying Leveraged ETF for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from 200% of the return of the Underlying Stock over the same period. The Underlying Leveraged ETF will lose money if the Underlying Stock's performance is flat over time, and as a result of daily rebalancing, the Underlying Stock volatility and the effects of compounding, it is even possible that the Fund will lose money over time while the Underlying Stock's performance increases over a period longer than a single day.

The Fund intends to initially reference the following products as Underlying Leveraged ETF:

(1) Leverage Share 2x Long XYZ Daily ETF (NASDAQ: XYZG). Investors can access information about XYZG, including its prospectus and the most recent shareholder reports, online through the SEC's website, using Registration Statement Nos. 333-271700 and 811-23872. This information, derived from XYZG's filings with the SEC, is essential for investors to understand XYZG's operations, investment strategy, and financial prospects. The description of XYZG's principal investment strategies as outlined here is directly sourced from its prospectus.

The Fund may reference additional products as Underlying Leveraged ETF as market and liquidity develop.

Due to the Underlying Leveraged ETF's investment exposure to the Underlying Stock, the Fund's investment exposure is concentrated in the financial services industry.

This document relates only to the securities offered hereby and does not relate to the Underlying Leveraged ETF or the Underlying Stock. The Fund has derived all disclosures contained in this document regarding the Underlying Leveraged ETF from publicly available documents. In connection with XYZG, none of the Fund, the Trust, the Adviser, or their respective affiliates has participated in the preparation of such documents or made any due diligence inquiry with respect to either fund. None of the Fund, the Trust, the Adviser, or their respective affiliates makes any representation that such publicly available documents or any other publicly available information regarding XYZG is accurate or complete. Furthermore, the Fund cannot give any assurance that all events occurring prior to the date hereof (including events that would affect the accuracy or completeness of the publicly available documents described above) that would affect the trading price of the Underlying Leveraged ETF have been publicly disclosed. Subsequent disclosure of any such events or the disclosure of or failure to disclose material future events concerning the Underlying Leveraged ETF could affect the value received with respect to your Shares and therefore the value of your Shares.

The Fund, the Trust, the Adviser, and their respective affiliates do not provide any representation regarding the performance of XYZG.

THE FUND, TRUST AND ADVISER ARE NOT AFFILIATED WITH XYZG, ITS TRUSTS, AND ITS SERVICE PROVIDERS.

PRINCIPAL RISKS OF INVESTING IN THE FUND

The principal risks of investing in the Fund are summarized below. As with any investment, there is a risk that you could lose all or a portion of your investment in the Fund. Each risk summarized below is considered a "principal risk" of investing in the Fund, regardless of the order in which it appears. Some or all of these risks may adversely affect the Fund's net asset value per share ("NAV"), trading price, yield, total return and/or ability to meet its investment objectives. For more information about the risks of investing in the Fund, see the section in the Fund's Prospectus titled "Additional Information About the Fund — Principal Risks of Investing in the Fund."

The Underlying Leveraged ETF Risk. The Fund invests in options contracts that are based on the value of the Underlying Leveraged ETF shares. This subjects the Fund to certain of the same risks as if it owned shares of the Underlying Leveraged ETF, even though it may not. By virtue of the Fund's investments in options contracts that are based on the value of the Underlying Leveraged ETF shares, the Fund may also be subject to the following risks:

Effects of Compounding and Market Volatility Risk — The Underlying Leveraged ETF shares' performance for periods greater than a trading day will be the result of each day's returns compounded over the period, which is likely to differ from 200% of the Underlying Stock's performance, before fees and expenses. Compounding has a significant impact on funds that are leveraged and that rebalance daily. The impact of compounding becomes more pronounced as volatility and holding periods increase and will impact each shareholder differently depending on the period of time an investment in the Underlying Leveraged ETF is held and the volatility of the Underlying Stock during the shareholder's holding period of an investment in the Underlying Leveraged ETF.

Leverage Risk — The Underlying Leveraged ETF obtains investment exposure in excess of its net assets by utilizing leverage and may lose more money in market conditions that are adverse to its investment objective than a fund that does not utilize leverage. An investment in the Underlying Leveraged ETF is exposed to the risk that a decline in the daily performance of the Underlying Stock will be magnified. This means that an investment in the Underlying Leveraged ETF will be reduced by an amount equal to 2% for every 1% daily decline in the Underlying Stock, not including the costs of financing leverage and other operating expenses, which would further reduce its value. The Underlying Leveraged ETF could lose an amount greater than its net assets in the event of an Underlying Stock decline of more than 50%.

Derivatives Risk — Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds (including ETFs), interest rates or indexes. Investing in derivatives may be considered aggressive and may expose the Underlying Leveraged ETF to greater risks, and may result in larger losses or smaller gains, than investing directly in the reference assets underlying those derivatives, which may prevent the Underlying Leveraged ETF from achieving its investment objective.

Counterparty Risk — If a counterparty is unwilling or unable to make timely payments to meet its contractual obligations or fails to return holdings that are subject to the agreement with the counterparty resulting in the Underlying Leveraged ETF losing money or not being able to meet its daily leveraged investment objective.

Underlying Stock Risk: Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the financial services industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but are not limited to government regulations, economic conditions, credit rating downgrades, changes in interest rates and decreased liquidity in credit markets. Profitability of these companies is largely dependent on the availability and cost of capital and can fluctuate significantly when interest rates change. Credit losses resulting from financial difficulties of borrowers also can negatively impact the sector. These companies are also subject to substantial government regulation and intervention, which may adversely impact the scope of their activities, the prices they can charge, the amount of capital they must maintain, and potentially, their size. The Underlying Stock performance may be affected by system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the financial services sector and the insurance industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Indirect Investments in the Underlying Leveraged ETF – Investors in the Fund will not have rights to receive dividends or other distributions or any other rights with respect to the Underlying Leveraged ETF but will be subject to declines in the performance of the Underlying Leveraged ETF. Although the Fund invests in the Underlying Leveraged ETF only indirectly, the Fund's investments are subject to loss as a result of these risks.

Derivatives Risk. Derivatives are financial instruments that derive value from the underlying reference asset or assets, such as stocks, bonds, or funds, interest rates or indexes. The Fund's investments in derivatives may pose risks in addition to, and greater than, those associated with directly investing in securities or other ordinary investments, including risk related to the market, imperfect correlation with underlying investments, higher price volatility, lack of availability, counterparty risk, liquidity, valuation and legal restrictions. The use of derivatives is a highly specialized activity that involves investment techniques and risks different from those associated with ordinary portfolio securities transactions. The use of derivatives may result in larger losses or smaller gains than directly investing in securities. When the Fund uses derivatives, there may be an imperfect correlation between the value of the Underlying Leveraged ETF and the derivative, which may prevent the Fund from achieving its investment objectives. Because derivatives often require only a limited initial investment, the use of derivatives may expose the Fund to losses in excess of those amounts initially invested. In addition, the Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For the Fund, in particular, the value of the options contracts in which it invests is substantially influenced by the value of the Underlying Leveraged ETF. Selling put options exposes the Fund to the risk of potential loss if the market value of the Underlying Leveraged ETF falls below the strike price before the option expires. The Fund may experience substantial downside from specific option positions and certain option positions held by the Fund may expire worthless. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the underlying instrument, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Fund will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of "rolling" may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Rolling refers to the practice of closing out one options position and opening another with a different expiration date and/or a different strike price. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. and generate specific risks.

Affiliated Fund Risk. In managing the Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF. Unaffiliated Underlying Leveraged ETF do not pay fee to the Adviser.

Counterparty Risk. The Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, the Fund's counterparty is a clearing house rather than a bank or broker. Since the Fund is not a member of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Fund will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, the Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by the Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of the Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of the Fund might not be fully protected in the event of the clearing member's bankruptcy, as the Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. The Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults the Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If the Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Price Participation Risk. The Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by the Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the Underlying Leveraged ETF share changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF share price. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF share will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the Underlying Leveraged ETF share price.

Distribution Risk. As part of the Fund's investment objective, the Fund seeks to provide current weekly income. There is no assurance that the Fund will make a distribution in any given week. If the Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, the weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

NAV Erosion Risk Due to Distributions. When the Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions by the Fund, if any, may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Fund has a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. The Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as The Nasdaq Stock Market, LLC (the "Exchange"), and may be traded on U.S. exchanges other than the Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Fund as it seeks to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of the Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the Exchange at a market price that may be below, at or above the Fund's NAV. Trading in Shares on the Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on the Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the Exchange "circuit breaker" rules. There can be no assurance that the requirements of the Exchange necessary to maintain the listing of the Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, the Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Fund may actively and frequently trade all or a significant portion of the Fund's holdings. A high portfolio turnover rate increases transaction costs, which may increase the Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Fund due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Fund, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for the Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If the Fund is forced to sell an illiquid security at an unfavorable time or price, the Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Fund.

Management Risk. The Fund is subject to management risk because it is an actively managed portfolio. In managing the Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that the Fund will meet its investment objective.

Money Market Instrument Risk. The Fund may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

New Fund Risk. The Fund is a recently organized management investment company with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.

Non-Diversification Risk. Because the Fund is "non-diversified," it may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause the Fund's overall value to decline to a greater degree than if the Fund held a more diversified portfolio.

Operational Risk. The Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Fund's service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. The Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect the Fund's ability to meet its investment objective. Although the Fund and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic, which has resulted in a public health crisis, disruptions to business operations and supply chains, stress on the global healthcare system, growth concerns in the U.S. and overseas, staffing shortages and the inability to meet consumer demand, and widespread concern and uncertainty. Continuing uncertainties regarding interest rates, rising inflation, political events, rising government debt in the U.S. and trade tensions also contribute to market volatility. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual security (the Underlying Leveraged ETF), may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Fund intends to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, the Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If the Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, the Fund will attempt to ensure that the value of the derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If the Fund's investments in the derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If the Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent the Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

U.S. Government and U.S. Agency Obligations Risk. The Fund may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

Fixed Income Securities Risk. The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

Investments in Fixed Income Securities may also involve the following risks, depending on the instrument involved:

- Asset-Backed/Mortgage-Backed Securities Risk – The market value and yield of asset-backed and mortgage-backed securities can vary due to market interest rate fluctuations and early prepayments of underlying instruments.
- Credit Risk – An investment in the Fund also involves the risk that the issuer of a Fixed Income Security that the Fund holds will fail to make timely payments of interest or principal or go bankrupt, or that the value of the securities will decline because of a market perception that the issuer may not make payments on time, thus potentially reducing the Fund's return.
- Event Risk – Event risk is the risk that corporate issuers may undergo restructurings, such as mergers, leveraged buyouts, takeovers, or similar events financed by increased debt. As a result of the added debt, the credit quality and market value of a company's bonds and/or other debt securities may decline significantly.
- Extension Risk – Payment on the loans underlying Fixed Income Securities held by the Fund may be made more slowly when interest rates are rising.
- Interest Rate Risk – Generally, the value of Fixed Income Securities will change inversely with changes in interest rates. As interest rates rise, the market value of Fixed Income Securities tends to decrease. Conversely, as interest rates fall, the market value of Fixed Income Securities tends to increase. This risk will be greater for long-term securities than for short-term securities. In recent periods, governmental financial regulators, including the U.S. Federal Reserve, have taken steps to maintain historically low interest rates. Very low or negative interest rates may magnify interest rate risk. Changes in government intervention may have adverse effects on investments, volatility, and illiquidity in debt markets.
- Prepayment Risk – When interest rates are declining, issuers of Fixed Income Securities held by the Fund may prepay principal earlier than scheduled.

Performance: Because the Fund has not yet launched, the performance section is omitted. In the future, performance information will be presented in this section of this Prospectus. Updated performance information, when available, will be available online at www.graniteshares.com or by calling 844-476-8747.

Portfolio Managers: Jeff Klearman, Ryan Dofflemeyer and Jeroen Visser have been portfolio managers of the Fund since the Fund's inception.

Purchase and Sale of Fund Shares: The Fund is an ETF. Individual Shares of the Fund may only be bought and sold in the secondary market (i.e., on a national securities exchange) through a broker-dealer at a market price. Because ETF shares trade at market prices rather than at NAV, Shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). An investor may incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase Shares of the Fund (bid) and the lowest price a seller is willing to accept for Shares of the Fund (ask) when buying or selling Shares in the secondary market (the "bid-ask spread"). The bid-ask spread varies over time for Shares based on trading volume and market liquidity, and is generally lower if the Fund's Shares have more trading volume and market liquidity and higher if the Fund's Shares have little trading volume and market liquidity. Recent information regarding the Fund, including its NAV, market price, premiums and discounts, and bid/ask spreads, is available on the Fund's website at www.graniteshares.com.

Tax Information: The Fund's distributions will be taxable to you, generally as ordinary income unless you are invested through a tax-advantaged arrangement, such as a 401(k) plan, IRA or other tax-advantaged account; in such cases, you may be subject to tax when assets are withdrawn from such tax-advantaged arrangement. A sale of Shares may result in capital gain or loss.

Payments to Broker-Dealers and Other Financial Intermediaries: If you purchase Shares of the Fund through a broker-dealer or other financial intermediary (such as a bank) (an "Intermediary"), the Adviser and/or its related companies may pay the Intermediary for the sale of Shares and related services. These payments may create a conflict of interest by influencing the Intermediary and your salesperson to recommend the Fund over another investment. Any such arrangements do not result in increased Fund expenses. Ask your salesperson or visit the Intermediary's website for more information.

ADDITIONAL INFORMATION ABOUT THE FUNDS' INVESTMENT OBJECTIVES, STRATEGIES AND RISKS

Investment Objective

GraniteShares YieldBOOST 20Y+ Treasuries ETF

The Fund's primary investment objective is to achieve 3 times (300%) the income generated from selling options on the ICE U.S. Treasury 20+ Year Bond Index (the "Underlying Index") by selling options on leveraged exchange-traded funds designed to deliver 3 times (300%) the daily performance of the Underlying Index (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

GraniteShares YieldBOOST AAPL ETF

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Apple Inc.'s common stock (NASDAQ: AAPL) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

GraniteShares YieldBOOST ADBE ETF

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Adobe Inc.'s common stock (NASDAQ: ADBE) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

GraniteShares YieldBOOST AMD ETF

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Advanced Micro Devices, Inc.'s common stock (NASDAQ: AMD) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

GraniteShares YieldBOOST AMZN ETF

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Amazon.com Inc.'s common stock (NASDAQ: AMZN) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

GraniteShares YieldBOOST APP ETF

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on AppLovin Corporation's common stock (NASDAQ: APP) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

GraniteShares YieldBOOST ARM ETF

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Arm Holdings plc's ADR (NASDAQ: ARM) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

GraniteShares YieldBOOST ASML ETF

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on ASML Holdings NV's ADR (NASDAQ: ASML) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

GraniteShares YieldBOOST AVGO ETF

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Broadcom Inc.'s common stock (NASDAQ: AVGO) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

GraniteShares YieldBOOST BABA ETF

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Alibaba Group Holding Limited's ADR (NYSE: BABA) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

GraniteShares YieldBOOST Biotech ETF

The Fund's primary investment objective is to achieve 3 times (300%) the income generated from selling options on the S&P Biotechnology Select Industry Index (the "Underlying Index") by selling options on leveraged exchange-traded funds designed to deliver 3 times (300%) the daily performance of the Underlying Index (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

GraniteShares YieldBOOST Bitcoin ETF

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on bitcoin (the "Underlying Asset") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

GraniteShares YieldBOOST BRKB ETF

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Berkshire Hathaway Inc.'s class B common stock (NYSE: BRK.B) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

GraniteShares YieldBOOST China ETF

The Fund's primary investment objective is to achieve 3 times (300%) the income generated from selling options on the FTSE China 50 Index (the "Underlying Index") by selling options on leveraged exchange-traded funds designed to deliver 3 times (300%) the daily performance of the Underlying Index (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

GraniteShares YieldBOOST COIN ETF

The Fund's primary investment objective is to achieve 2 times (200%) the income generated from selling options on Coinbase Global, Inc.'s Class A common stock (NASDAQ: COIN) (the "Underlying Stock") by selling options on leveraged exchange-traded funds designed to deliver 2 times (200%) the daily performance of the Underlying Stock (the "Underlying Leveraged ETF"). The Fund's secondary investment objective is to gain exposure to the performance of the Underlying Leveraged ETF, subject to a cap on potential investment gains. A downside protection may be implemented which could affect the net income level.

GraniteShares YieldBOOST CRCL ETF

PRINCIPAL INVESTMENT STRATEGIES

GraniteShares YieldBOOST 20Y+ Treasuries ETF, GraniteShares YieldBOOST Biotech ETF, GraniteShares YieldBOOST China ETF, GraniteShares YieldBOOST Financials ETF, GraniteShares YieldBOOST QQQ ETF, GraniteShares YieldBOOST Semiconductor ETF, GraniteShares YieldBOOST Small Cap ETF, GraniteShares GraniteShares YieldBOOST SPY ETF and GraniteShares YieldBOOST Technology ETF.

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 3 times the daily performance of the Underlying Index. It is expected that the implied volatility on the Underlying Leveraged ETF to be three times the level of the Underlying Index's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, three times the premium generated by selling options on the Underlying Index. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Index.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be three times the losses compared to the Underlying Index. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

GraniteShares YieldBOOST Gold Miners ETF

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Index. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Index. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

GraniteShares YieldBOOST Bitcoin ETF and GraniteShares YieldBOOST Ether ETF

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Asset. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Asset's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Asset. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Asset.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Asset. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

The Fund is an actively managed exchange-traded fund ("ETF") that seeks to pay weekly distributions by selling put options on the Underlying Leveraged ETF, which provides exposure to 2 times the daily performance of the Underlying Stock. It is expected that the implied volatility on the Underlying Leveraged ETF to be twice the level of the Underlying Stock's implied volatility and selling options on the Underlying Leveraged ETF to generate, over the same time horizon and for the same strike levels, twice the premium generated by selling options on the Underlying Stock. The premium received by the Fund from selling options will be distributed at least partially before the maturity of the options. This allows the Fund to make distributions on a weekly basis even if the options sold have longer maturity (such as monthly maturity for instance). This approach may result in the distributions being treated fiscally as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund"). There is no guarantee that the Fund will generate twice the level of premium that would be generated by selling options on the Underlying Stock.

The Fund is subject to the losses from the Underlying Leveraged ETF, which would likely be two times the losses compared to the Underlying Stock. In case a Put Spread Strategy (as defined under the section "The Fund's Use of the Underlying Leveraged ETF Derivatives Contracts") is implemented, the Fund may benefit from a limited downside protection against a negative price variation in the Underlying Leveraged ETF. Such protection will negatively affect the Fund's overall income level. A put spread strategy with a narrow spread (the difference between the strikes of the put option sold and put option bought) may provide better protection but will have a higher negative impact on the Fund's income level. A put spread strategy with a large spread will provide a lower protection but may have less negative impact on the Fund's income level.

The Fund will invest at least 80% of its net assets (plus any borrowings for investment purposes) in derivatives contracts that utilize the Underlying Leveraged ETF as their reference asset. For purposes of compliance with this investment policy, derivative contracts will be valued at their notional value.

There is no guarantee that each Fund's investment strategy will be properly implemented or that each Fund will pay weekly distributions, and an investor may lose some or all of its investment. Even when the Fund makes a distribution it could be fiscally treated as return of capital (see "Distribution Risk" under the section "Principal Risks of Investing in the Fund").

Each Fund's NAV is dependent on the value of the Fund's options contracts and swaps on options contracts, which are based principally upon the price of its Underlying Leveraged ETF, and the time remaining until the expiration date of the options contracts.

Each Fund will adopt a Put Spread Strategy and a Put Write Strategy:

- Put Spread Strategy: The Fund will enter in put spread options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which the Fund will receive a net premium. Buying a put option contract results in a cost that negatively affects the Fund's income level. It is unlikely for a put spread strategy to generate twice or three times the level of income that would be obtained by selling options on the underlying asset directly. The Fund's participation in a potential increase in the price of the Underlying Leveraged ETF only applies if the Fund sells in-the-money put options contracts. The Fund's protection against a potential decrease in the price of the Underlying Leveraged ETF only applies if it falls below the strike price of the option contract bought by the Fund. The put options contracts sold by the Fund may vary in regard to their strike price from 0 to 15% above the then-current price of the Leveraged ETF. The put options contracts bought by the Fund will have a lower strike price, ranging from 50% out-of-the-money to at-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates.

- Put Write Strategy: The Fund will sell put options contracts, either directly or through swap contracts, on the Underlying Leveraged ETF and for which it will receive a premium. The put options contracts sold by the Fund may vary in regard to their strike prices from 40% out-of-the-money to 15% in-the-money. The put options sold and bought by the Fund will generally have 1- month or less expiration dates. The Adviser will primarily employ this put write strategy when it believes that the share price of its Underlying Leveraged ETF is likely to rise significantly in the short term (e.g., following a substantial selloff or overall positive market news).

The Fund's cash balance may be invested in the following instruments: (1) U.S. Government securities, such as bills, notes and bonds issued by the U.S. Treasury; (2) money market funds; (3) short term bond ETFs; (4) corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade or of comparable quality as collateral for the Fund's swap agreements; (5) repurchase transactions, which are transactions under which the purchaser (*i.e.*, the Fund) acquires securities and the seller agrees, at the time of the sale, to repurchase the securities at a mutually agreed-upon time and price, thereby determining the yield during the purchaser's holding period, and/or; (6) US equities listed on a national security exchange, sovereign fixed income securities with a credit rating at least equal to the United States Federal Government, or corporate debt securities, such as commercial paper and other short-term unsecured promissory notes issued by businesses that are rated investment grade for the purposes of entering into swap agreements with the Fund's swap counterparties, and/or; (7) and in the securities of one or more ETFs designed to provide exposure to short-term investments, including the GraniteShares Short Term Box ETF ("LBOX"), which is advised by GraniteShares Advisors LLC, the Fund's investment adviser. LBOX is an actively managed ETF that seeks to generate a short-term, fixed-income-like return through a market-neutral strategy involving simultaneous long and short synthetic options positions (known as "box spreads") on exchange-listed reference assets.

Generally, each Fund is fully exposed to the downward movements of its Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. Each Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of its Underlying Leveraged ETF's decline.

The Funds may sell or buy FLexible EXchange® ("FLEX") put options contracts as well as enter into swap contracts providing a similar exposure to buying and/or selling put options contracts. The following provides an overview of the core concepts:

Put Options Overview:

Buyer of a Put Option: Pays for the right to sell an underlying asset (like an ETF) at a fixed, predetermined price.

Seller of a Put Option (e.g., a Fund): Collects a premium and commits to potentially buying the underlying asset if the buyer exercises its option.

Profit and Loss Scenarios for put options contracts sold by the Funds and held at maturity:

- Underlying Leveraged ETF share price rises above the strike price (profitable): The Fund would either close out the position profitably or retain the premium without any additional liability.
- Underlying Leveraged ETF share price remains at the strike price (breakeven): If the Underlying Leveraged ETF share price remains at the strike price, the option remains at-the-money. In this case, the Fund would either close out the position (with no material gain or loss), or the transaction would result in no settlement, and the Fund would retain the premium with no additional liability.
- Underlying Leveraged ETF share price drops below the strike price (potentially unprofitable): The Fund would need to pay the difference between the strike price and the current Underlying Leveraged ETF share price. This could potentially negate some of the premium received, or lead to a net loss, which could be substantial.

Valuation and Regulation:

The Funds will use the market value of their derivatives when checking compliance with the 1940 Act and related rules.

Since the Funds' options are exchange-traded, they will be valued using a mark-to-market method. If market prices are not accessible, the Funds will rely on fair value pricing as set by the Board.

Additional Concepts:

At-the-money put options: The strike price equals the current market price of the Underlying Leveraged ETF's shares.

In-the-money put options: The strike price is more favorable than the current market price of the Underlying Leveraged ETF's shares.

Out-of-the-money put options: The strike price is less favorable than the current market price of the Underlying Leveraged ETF's shares.

Expiration: Options must be exercised or traded by a certain date; otherwise, they lapse.

Time Decay: The option's value declines over time, benefiting the seller (here, a Fund). If all other factors are constant, this decreasing value could mean potential profit for the seller.

Terminology:

Current Income: The extrinsic value of a sold put option.

Potential Income: The potential profit if the value of the Underlying Leveraged ETF's shares rises.

Example: Imagine the price of Underlying Leveraged ETF's shares is $200. A put option with a strike price of $205 is sold for $60. The difference between the strike price and the price of the Underlying Leveraged ETF's share is $5 (in-the-money amount). The remaining $55 (the $60 put price minus the $5 in-the-money amount) represents the extrinsic value. Here, the current income is $55, and the potential income is $5. If the price of the Underlying Leveraged ETF's share is $205 or more when the option matures, the Fund gains the full $60. If the price of the Underlying Leveraged ETF's share remains at $200 when the option matures, the Fund makes only $55.

Principal Risks of Investing in the Funds

Underlying Leveraged ETF used by the GraniteShares YieldBOOST 20Y+ Treasuries ETF.

Concentration Risk — The ICE U.S. Treasury 20+ Year Bond Index has a significant portion of its value in U.S. Government Securities. The Underlying Leveraged ETF will allocate its investments to approximately the same extent as the ICE U.S. Treasury 20+ Year Bond Index. As a result, the Underlying Leveraged ETF may be subject to greater market fluctuations than a fund that is more broadly invested across industries.

U.S. Government Securities Risk — A security backed by the U.S. Treasury or the full faith and credit of the United States is guaranteed only as to the timely payment of interest and principal when held to maturity. The market prices for such securities are not guaranteed and will fluctuate. Furthermore, not all securities issued by the U.S. government and its agencies and instrumentalities are backed by the U.S. Treasury or the full faith and credit of the United States. In addition, because many types of U.S. government securities trade actively outside the United States, their prices may rise and fall as changes in global economic conditions affect the demand for these securities. In addition, U.S. Treasury obligations may differ from other securities in their interest rates, maturities, times of issuance and other characteristics. Changes in the financial condition or credit rating of the U.S government may cause the value of U.S. Treasury obligations to decline.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST AAPL ETF.

Industry Concentration Risk — The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the computer and information technology sector. The value of stocks of computer technology companies and companies that rely heavily on computer technology is particularly vulnerable to rapid changes in technology product cycles, rapid product obsolescence, government regulation, and competition, both domestically and internationally, including competition from competitors with lower production costs. In addition, many computer technology companies have limited product lines, markets, financial resources or personnel. The prices of computer technology companies and companies that rely heavily on computer technology, especially those of smaller, less-seasoned companies, tend to be more volatile and less liquid than the overall market. Computer technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the computer technology sector may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST ADBE ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the software and information technology industry. The value of stocks of information technology companies and companies that rely heavily on technology is particularly vulnerable to rapid changes in technology product cycles, rapid product obsolescence, government regulation, and competition, both domestically and internationally, including competition from competitors with lower production costs. In addition, many information technology companies have limited product lines, markets, financial resources or personnel. The prices of information technology companies and companies that rely heavily on technology, especially those of smaller, less-seasoned companies, tend to be more volatile and less liquid than the overall market. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the information technology industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST AMD ETF.

Industry Concentration Risk — The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the semiconductor industry. The risks of investments in the semiconductor industry include: intense competition, both domestically and internationally, including competition from subsidized foreign competitors with lower production costs; wide fluctuations in securities prices due to risks of rapid obsolescence of products; economic performance of the customers of semiconductor companies; their research costs and the risks that their products may not prove commercially successful; capital equipment expenditures that could be substantial and suffer from rapid obsolescence; and thin capitalization and limited product lines, markets, financial resources or personnel. The semiconductor industry may also be affected by risks that affect the broader technology sector, including: government regulation; dramatic and often unpredictable changes in growth rates and competition for qualified personnel; heavy dependence on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability; and a small number of companies representing a large portion of the technology sector as a whole.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST AMZN ETF.

Industry Concentration Risk — The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the online retail company industry. Companies that operate in the online marketplace and retail segments are subject to fluctuating consumer demand. Unlike traditional brick and mortar retailers, online marketplaces and retailers must assume shipping costs or pass such costs to consumers. Consumer access to price information for the same or similar products may cause companies that operate in the online marketplace and retail segments to reduce profit margins in order to compete. Due to the nature of their business models, companies that operate in the online marketplace and retail segments may also be subject to heightened cyber security risk, including the risk of theft or damage to vital hardware, software and information systems. The loss or public dissemination of sensitive customer information or other proprietary data may negatively affect the financial performance of such companies to a greater extent than traditional brick and mortar retailers. As a result of such companies being web-based and the fact that they process, store, and transmit large amounts of data, including personal information, for their customers, failure to prevent or mitigate data loss or other security breaches, including breaches of vendors' technology and systems, could expose companies that operate in the online marketplace and retail segments or their customers to a risk of loss or misuse of such information, adversely affect their operating results, result in litigation or potential liability, and otherwise harm their businesses.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST APP ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the software and information technology industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk and the risk of natural disasters. The Underlying Stock performance may be affected by global markets and demand for its products and services, its ability to develop new products and services, inventory levels, supply chain issues, the performance of third-party software developers, system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the information technology industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST ARM ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the semiconductor industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock performance may be affected by global markets and demand for its products and services, its ability to develop new products and services, inventory levels, supply chain issues, the performance of third-party software developers, system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the information technology industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST ASML ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the semiconductor industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. Underlying Leveraged ETF used by the GraniteShares YieldBOOST Biotech ETF.

Industry Concentration Risk — The S&P Biotechnology Select Industry Index may have a significant portion of its value in issuers in an industry or group of industries. The Underlying Leveraged ETF will allocate its investments to approximately the same extent as the S&P Biotechnology Select Industry Index. As a result, Underlying Leveraged ETF may be subject to greater market fluctuations than a fund that is more broadly invested across industries. As of September 30, 2026, the S&P Biotechnology Select Industry Index had 165 constituents which had a median market capitalization of $5.1 billion, total market capitalizations ranging from $340.0 million to $378.10 billion and were concentrated in the healthcare sector, the GICS sector in which the biotechnology industry is included.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST Bitcoin ETF.

Bitcoin Futures Investing Risk — The Underlying Leveraged ETF is indirectly exposed to the risks of investing in bitcoin through its investments in bitcoin futures contracts. Bitcoin is a new and highly speculative investment. The risks associated with bitcoin include the following:

- *Bitcoin is a new technological innovation with a limited history*. There is no assurance that usage of bitcoin will continue to grow. A contraction in use of bitcoin may result in increased volatility or a reduction in the price of bitcoin, which could adversely impact the value of the Underlying Leveraged ETF. The bitcoin network was launched in January 2009, platform trading in bitcoin began in 2010, and bitcoin futures trading began in 2017, each of which limits a potential shareholder's ability to evaluate an investment in the Underlying Leveraged ETF.

- *The* Underlying Leveraged ETF*'s investments in bitcoin futures contracts are exposed to risks associated with the price of bitcoin, which is subject to numerous factors and risks*. The price of bitcoin is impacted by numerous factors, including:

    - The total and available supply of bitcoin, including the possibility that a small group of early bitcoin adopters hold a significant proportion of the bitcoin that has thus far been created and that sales of bitcoin by such large holders may impact the price of bitcoin;
    - Global bitcoin demand, which is influenced by the growth of retail merchants' and commercial businesses' acceptance of bitcoin as payment for goods and services, the security of online digital asset trading platforms and public bitcoin addresses that hold bitcoin, the perception that the use and holding of bitcoin is safe and secure, the lack of regulatory restrictions on their use, and the reputation regarding the use of bitcoin for illicit purposes;
    - The fact that bitcoin is not presently widely accepted as a medium of exchange, which may be due to a number of common impediments and/or disadvantages to adopting the bitcoin network as a payment network, including the slowness of transaction processing and finality, variability of transaction fees, and volatility of the price of bitcoin;

- Global bitcoin supply, which is influenced by similar factors as global bitcoin demand, in addition to fiat currency (i.e., government currency not backed by an asset such as gold) needs by miners and taxpayers who may liquidate bitcoin holdings to meet tax obligations;
- Investors' expectations with respect to the rate of inflation of fiat currencies and deflation of bitcoin;
- Foreign exchange rates between fiat currencies and digital assets such as bitcoin;
- Interest rates;
- The continued operation of digital asset trading platforms in the United States and foreign jurisdictions, including their regulatory status, trading and custody policies, and cyber security;
- Investment and trading activities of large investors, including private and registered funds, that may directly or indirectly invest in bitcoin;
- Regulatory measures, if any, that restrict the use of bitcoin as a form of payment or the purchase or sale of bitcoin, including measures that restrict the direct or indirect participation in the bitcoin market by financial institutions or the introduction of bitcoin instruments;
- The maintenance and development of the open-source software protocol of the bitcoin network;
- Increased competition from other cryptocurrencies and digital assets, including forks of the bitcoin network;
- Developments in the information technology sector;
- Global or regional political, economic or financial events and situations;
- Investor or bitcoin network participant sentiments on the value or utility of bitcoin; and
- The dedication of mining power to the Bitcoin Network and the willingness of bitcoin miners to clear bitcoin transactions for relatively low fees.

Underlying Leveraged ETF used by GraniteShares YieldBOOST BRKB ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the financial services sector and the insurance industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but are not limited to government regulations, economic conditions, credit rating downgrades, changes in interest rates and decreased liquidity in credit markets. Profitability of these companies is largely dependent on the availability and cost of capital and can fluctuate significantly when interest rates change. Credit losses resulting from financial difficulties of borrowers also can negatively impact the sector. These companies are also subject to substantial government regulation and intervention, which may adversely impact the scope of their activities, the prices they can charge, the amount of capital they must maintain, and potentially, their size. The Underlying Stock performance may be affected by system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the financial services sector and the insurance industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST China ETF.

Country Concentration Risk — The FTSE China 50 Index has a significant portion of its value in Chinese companies currently trading on the Hong Kong Stock Exchange. The Underlying Leveraged ETF will allocate its investments to approximately the same extent as the FTSE China 50 Index. As a result, the Underlying Leveraged ETF may be subject to greater market fluctuations than a fund that is more broadly invested across industries. Although the economy of China has been in a state of transition from a government-planned socialist economy to a more market-oriented economy since the 1970s, the level of government involvement in China's economy continues to distinguish it from other global markets as the majority of productive assets in China are owned (at different levels) by the People's Republic of China ("China" or the "PRC") government. Due to PRC government economic reforms during the last 30 years, China's economy, as reflected in the value of Chinese issuers, has experienced significant growth. There can be no assurance, however, that the PRC government will continue to pursue such reforms. As of September 30, 2026, the FTSE China 50 Index constituents had a median market capitalization of 16.1 billion, total market capitalizations ranging from $1.6 billion to $142.1 billion and banks represented the largest sector with 26% of the index. The FTSE China 50 Index is rebalanced and reviewed quarterly.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST COIN ETF.

Industry Concentration Risk — The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the digital asset and finance services industries. Such companies may be adversely impacted by government regulations, economic conditions and deterioration in credit markets. These companies typically face intense competition and could be negatively affected by new entrants into the market, especially those located in markets with lower production costs. Competitors in the digital payments space include financial institutions and well-established payment processing companies. In addition, many companies engaged in these businesses store sensitive consumer information and could be the target of cybersecurity attacks and other types of theft, which could have a negative impact on these companies. Online digital asset trading platforms currently operate under less regulatory scrutiny than traditional financial services companies and banks, but there is a significant risk that regulatory oversight could increase in the future. Higher levels of regulation could increase costs and adversely impact the current business models of some digital asset-related companies and could severely impact the viability of these companies. These companies could be negatively impacted by disruptions in service caused by hardware or software failure, or by interruptions or delays in service by third-party data center hosting facilities and maintenance providers.

Underlying Leveraged ETF used by GraniteShares YieldBOOST CRCL ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the software and service industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability, including, but are not limited to competitive pressures, such as aggressive pricing, technological developments, cyclical market patterns, changing domestic demand, the ability to attract and retain skilled employees, and dependence on intellectual property rights and potential loss or impairment of those rights. The Underlying Stock performance may be affected by system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Software and service industry companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Leveraged ETF's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST CRWD ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the software and information technology industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk and the risk of natural disasters. The Underlying Stock performance may be affected by global markets and demand for its products and services, its ability to develop new products and services, inventory levels, supply chain issues, the performance of third-party software developers, system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the information technology industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST CRWV ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the computer software industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk and the risk of natural disasters. The Underlying Stock performance may be affected by competition in the microprocessor market, reliance on third-party manufacturers, the company's ability to develop new products, losses of significant customers, changes in customer demand for its products, risks associated with defective products, political, legal and economic risks affecting the company's global operations. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST DJT ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the interactive media and services industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but are not limited to the following factors: industry competition, increasing governmental regulation, the ability to keep pace with technological advancement and scrutiny by public bodies. Technological innovations may reduce the utility of products and services of companies in the communication services sector and render them less competitive or obsolete over time. These companies may need to commit substantial capital investment to deal with increasing competition and to keep pace with technological enhancement in order to remain competitive. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST Ether ETF.

Ether Investing Risk: The Underlying Leveraged ETF is indirectly exposed to the risks of investing in ether through its investments in ether futures contracts. Ether is a relatively new innovation and is subject to unique and substantial risks. The market for ether is subject to rapid price swings, changes and uncertainty. A significant portion of the demand for ether may be the result of speculation. Consequently, the value of ether has been, and may continue to be, substantially dependent on speculation. Such speculation regarding the potential future appreciation of the price of ether may artificially inflate or deflate the price of ether and increase volatility. The further development of the Ethereum Network and the acceptance and use of ether are subject to a variety of factors that are difficult to evaluate. The slowing, stopping or reversing of the development of the Ethereum Network or the acceptance of ether may adversely affect the price and liquidity of ether. Ether is subject to the risk of fraud, theft, manipulation or security failures, operational or other problems that impact ether trading venues. Additionally, if one or a coordinated group of validators were to gain control of 33% or more of staked ether, they would have the ability to execute extensive attacks, manipulate transactions and fraudulently obtain ether. If such a validator or group of validators were to gain control of one-third of staked ether, they could halt payments. A significant portion of ether is held by a small number of holders sometimes referred to as "whales". Transactions by these holders may influence the price of ether and these holders may have the ability to manipulate the price of ether.

Unlike the exchanges for more traditional assets, such as equity securities and futures contracts, ether and ether trading venues are largely unregulated and may be operating out of compliance with applicable regulation. As a result of the lack of regulation, individuals or groups may engage in fraud or market manipulation (including using social media to promote ether in a way that artificially increases the price of ether). Investors may be more exposed to the risk of theft, fraud and market manipulation than when investing in more traditional asset classes. Over the past several years, a number of ether trading venues have been closed due to fraud, failure or security breaches. Investors in ether may have little or no recourse should such theft, fraud or manipulation occur and could suffer significant losses.

Legal or regulatory changes may negatively impact the operation of the Ethereum Network or restrict the use of ether. For example, if ether were determined to be or were expected to be determined to be a security under the federal securities laws, it is possible certain trading venues would no longer facilitate trading in ether, trading in ether futures may become significantly more volatile and/or completely halted, and the value of an investment in the Underlying Leveraged ETF could decline significantly and without warning, including to zero.

The realization of any of these risks could result in a decline in the acceptance of ether and consequently a reduction in the value of ether, ether futures, and the Underlying Leveraged ETF.

Finally, the creation of a "fork" (as described in the Fund's principal investment strategy) or a substantial giveaway of ether (sometimes referred to as an "air drop") may result in significant and unexpected declines in the value of ether, ether futures, and the Underlying Leveraged ETF. A fork may be intentional, such as the 'Merge.' The 'Merge' refers to protocol changes altering the method by which transactions are validated.

Ether Futures Investing Risk: The market for ether futures may be less developed, and potentially less liquid and more volatile, than more established futures markets. While the ether futures market has grown substantially since ether futures commenced trading, there can be no assurance that this growth will continue. The price for ether futures contracts is based on a number of factors, including the supply of and the demand for ether futures contracts. Market conditions and expectations, regulatory limitations or limitations imposed by the listing exchanges or futures commission merchants ("FCMs") (e.g., margin requirements, position limits, and accountability levels), collateral requirements, availability of counterparties, and other factors each can impact the supply of and demand for ether futures contracts.

Market conditions and expectations, margin requirements, position limits, accountability levels, collateral requirements, availability of counterparties, and other factors may also limit the Underlying Leveraged ETF's ability to achieve its desired exposure to ether futures contracts. If the Underlying Leveraged ETF is unable to achieve such exposure it may not be able to meet its investment objective and the Underlying Leveraged ETF's returns may be different or lower than expected. Additionally, collateral requirements may require the Underlying Leveraged ETF to liquidate its positions, potentially incurring losses and expenses, when it otherwise would not do so. Investing in derivatives like ether futures may be considered aggressive and may expose the Underlying Leveraged ETF to significant risks. These risks include counterparty risk and liquidity risk.

The performance of ether futures contracts, in general, has historically been highly correlated to the performance of ether. However, there can be no guarantee this will continue. Transaction costs (including the costs associated with futures investing), position limits, the availability of counterparties and other factors may impact the cost of ether futures contracts and decrease the correlation between the performance of ether futures contracts and ether, over short or even long-term periods. In the event that there are persistent disconnects between ether and ether futures, the Underlying Leveraged ETF may not be able to obtain the desired leveraged exposure and may not be able to achieve its investment objective.

In addition, the performance of back-month futures contracts is likely to differ more significantly from the performance of the spot prices of ether. To the extent the Underlying Leveraged ETF is invested in back-month ether future contracts, the performance of the Underlying Leveraged ETF should be expected to deviate more significantly from the performance of ether. Moreover, price differences between ether and ether futures will expose the Underlying Leveraged ETF to risks different from, and possibly greater than, the risks associated with investing directly in ether, including larger losses or smaller gains.

Cost of Futures Investment Risk: When an ether futures contract is nearing expiration, the Underlying Leverage ETF will "roll" the futures contract, which means it will generally sell such contract and use the proceeds to buy a ether futures contract with a later expiration date. When rolling futures contracts that are in contango, the Underlying Leveraged ETF would sell a lower priced, expiring contract and purchase a higher priced, longer-dated contract. The price difference between the expiring contract and longer-dated contract associated with rolling ether futures is typically substantially higher than the price difference associated with rolling other futures contracts. Ether futures have historically experienced extended periods of contango. Contango in the ether futures market may have a significant adverse impact on the performance of the Underlying Leveraged ETF and may cause ether futures and the Underlying Leveraged ETF to underperform spot ether. Both contango and backwardation would reduce the Underlying Leveraged ETF's correlation to spot ether and may limit or prevent the Underlying Leveraged ETF from achieving its investment objective. The impact of both contango and backwardation may also be greater to the extent the Underlying Leveraged ETF invests in back-month futures contracts.

Ether Futures Capacity Risk: If the Underlying Leveraged ETF's ability to obtain exposure to ether futures contracts consistent with its investment objective is disrupted for any reason including, for example, limited liquidity in the ether futures market, a disruption to the ether futures market, or as a result of margin requirements, position limits, accountability levels, or other limitations imposed by the Underlying Leveraged ETF's futures commission merchants ("FCMs"), the listing exchanges or the CFTC, the Underlying Leveraged ETF may or may not be able to achieve its investment objective and may experience significant losses.

In such circumstances, the Underlying Leverage ETF's advisor may take such action as it believes appropriate and in the best interest of the Underlying Leverage ETF. Any disruption in the Underlying Leveraged ETF's ability to obtain leveraged exposure to ether futures contracts may cause the Underlying Leveraged ETF's performance to deviate from its investment objective.

Additionally, the ability of the Underlying Leveraged ETF to obtain leveraged exposure to ether futures contracts is limited by certain tax rules that limit the amount the Underlying Leveraged ETF can invest in its wholly-owned subsidiary as of the end of each tax quarter. As a result, the Underlying Leverage ETF may or may not be able to obtain leveraged exposure consistent with its investment objective and may or may not meet its investment objective on the last business day of each tax quarter (e.g., April 30, 2025, July 31, 2025, October 31, 2025, January 30, 2026). Exceeding this amount on such dates would have tax consequences.

Commodity Regulatory Risk. The Underlying Leveraged ETF's use of commodities futures subject to regulation by the CFTC has caused the Underlying Leveraged ETF to be classified as a "commodity pool" and this designation requires that the Underlying Leveraged ETF comply with CFTC rules, which may impose additional regulatory requirements and compliance obligations. The Underlying Leveraged ETF's investment decisions may need to be modified, and commodity contract positions held by the Underlying Leveraged ETF may have to be liquidated at disadvantageous times or prices, to avoid exceeding any applicable position limits established by the CFTC, potentially subjecting the Underlying Leveraged ETF to substantial losses. The regulation of commodity transactions in the United States is subject to ongoing modification by government, self-regulatory and judicial action. The effect of any future regulatory change with respect to any aspect of the Underlying Leveraged ETF is impossible to predict, but could be substantial and adverse to the Underlying Leveraged ETF.

Digital Asset Industry Risk: The digital asset industry is a new, speculative, and still-developing industry that faces many risks. In this emerging environment, events that are not directly related to the security or utility of the Ethereum Network can nonetheless precipitate a significant decline in the price of ether. For instance, in May 2022, the collapse of the algorithmic stablecoin TerraUSD and its paired crypto asset LUNA destroyed an estimated $60 billion in value in the crypto ecosystem. Although TerraUSD and LUNA operated on their own blockchain (the "Terra" blockchain), the events nonetheless contributed to a sharp decline in the price of ether, which fell 31% from May 1, 2022, to May 31, 2022. As another example, in November 2022, FTX Trading Ltd. – an offshore digital asset trading venue specializing in crypto derivatives – collapsed and filed for bankruptcy. While a small fraction of total global trading volume in ether and related derivatives took place on FTX-related venues, the company's collapse nonetheless contributed to a significant decline in the price of ether, which fell 18% in November 2022. Additional instability, failures, bankruptcies or other negative events in the digital asset industry, including events that are not necessarily related to the security or utility of the Ethereum Network, could similarly negatively impact the price of ether, and thereby the ether futures contracts held by the Underlying Leveraged ETF.

Digital Asset Regulatory Risk: Digital asset markets in the U.S. exist in a state of regulatory uncertainty, and adverse legislative or regulatory developments could significantly harm the value of ether futures contracts or the Underlying Leveraged ETF's shares, such as by banning, restricting or imposing onerous conditions or prohibitions on the use of ether, mining activity, digital wallets, the provision of services related to trading and custodying digital assets, the operation of the Ethereum Network, or the digital asset markets generally. Such occurrences could also impair the Underlying Leveraged ETF's ability to meet its investment objective pursuant to its investment strategy.

Reverse Repurchase Agreements Risk: Reverse repurchase agreements involve both counterparty risk and the risk that the value of securities that the Underlying Leveraged ETF is obligated to repurchase under the agreement may decline below the repurchase price. Reverse repurchase agreements involve leverage risk; the Underlying Leveraged ETF may lose money as a result of declines in the values both of the security subject to the reverse repurchase agreement and the instruments in which the Underlying Leveraged ETF invested the proceeds of the reverse repurchase agreement.

Subsidiary Investment Risk: Changes in the laws of the United States and/or the Cayman Islands, under which the Underlying Leveraged ETF and its wholly-owned Cayman subsidiary are organized, respectively, could result in the inability of the Underlying Leveraged ETF to operate as intended and could negatively affect the Underlying Leveraged ETF and its shareholders (such as the Fund). The Underlying Leveraged ETF's Cayman subsidiary is not registered under the 1940 Act and is not subject to all the investor protections of the 1940 Act.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST Financials ETF.

Industry Concentration Risk — The Financial Select Sector Index may have a significant portion of its value in issuers in an industry or group of industries. The Underlying Leveraged ETF will allocate its investments to approximately the same extent as the Financial Select Sector Index. As a result, the Underlying Leveraged ETF may be subject to greater market fluctuations than a fund that is more broadly invested across industries. As of September 30, 2026, the Financial Select Sector Index was comprised of 76 constituents which had a median total market capitalization of $44.55 billion, total market capitalizations ranging from $45.6 billion to $1.13 trillion. The Financial Select Sector Index is rebalanced quarterly.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST Gold Miners ETF.

Industry Concentration Risk — The NYSE Arca Gold Miners Index may have a significant portion of its value in issuers in an industry or group of industries. The Underlying Leveraged ETF will allocate its investments to approximately the same extent as the NYSE Arca Gold Miners Index. As a result, the Underlying Leveraged ETF may be subject to greater market fluctuations than a fund that is more broadly invested across industries. As of September 30, 2026, the NYSE Arca Gold Miners Index had 35 constituents, which had an average market capitalization of $45.3 billion, total market capitalizations ranging from $750 million to $78.7 billion. The NYSE Arca Gold Miners Index is rebalanced quarterly.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST GOOGL ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk and the risk of natural disasters. The Underlying Stock performance may be affected by changes in advertising revenues, increased competition and ability to retain users and customers, its ability to enforce the company's intellectual property rights, manufacturing and supply chain risks, global market conditions, cyber-attacks and changes in regulatory oversight. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST HIMS ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the healthcare providers and services industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but are not limited to changing economic conditions, evolving patient demographics, and fluctuations in demand for healthcare services. Profitability in this industry is often dependent on reimbursement rates from government programs and private payors, as well as the ability to manage operational costs effectively. Changes in healthcare regulations and policies, including those related to insurance coverage and reimbursement, can materially impact the industry. Companies in the healthcare providers and services industry are subject to extensive and frequently changing government regulation, which may affect the scope of their activities, the rates they can charge for services, and their compliance costs. Additionally, the industry faces risks related to litigation, operational disruptions, and evolving technologies that may alter traditional service delivery models. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST HOOD ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the investment banking and brokerage industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock operates in a heavily regulated and supervised environment. The impact interpretation, and enforcement of new rules can have major impacts on its operations. The Underlying Stock has material exposure to market, credit, and liquidity risks. The Underlying Stock relies on complex systems, and its inability to operate them accurately and timely could materially impact its ability to operate. The Underlying Stock may be significantly affected by stock and bank trading activity, continuing increases in price competition, decreases in fees or fee-related business, including investment banking, brokerage, asset management and other servicing fees, fluctuation in interest rates and other factors which could adversely affect financial markets.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST INTC ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the semiconductor industry. The risks of investments in the semiconductor industry include: intense competition, both domestically and internationally, including competition from subsidized foreign competitors with lower production costs; wide fluctuations in securities prices due to risks of rapid obsolescence of products; economic performance of the customers of semiconductor companies; their research costs and the risks that their products may not prove commercially successful; capital equipment expenditures that could be substantial and suffer from rapid obsolescence; and thin capitalization and limited product lines, markets, financial resources or personnel. The semiconductor industry may also be affected by risks that affect the broader technology sector, including government regulation; dramatic and often unpredictable changes in growth rates and competition for qualified personnel; heavy dependence on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability; and a small number of companies representing a large portion of the technology sector as a whole. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST IONQ ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the electronic data processing industry. Any data breaches, unauthorized access, data loss due to system malfunctions, cyberattacks, privacy violations, data integrity issues, system outages, hardware failures, software vulnerabilities, human error, and power disruptions; essentially, any threat that could compromise the confidentiality, integrity, or availability of stored or processed data could have a material adverse effect on the Underlying Stock, its prospects and financial performance. Worldwide economic conditions could have an effect on the demand for the Underlying Stock's services and products and could result in declining revenue and earnings. General economic declines or a softening of the economy make it more likely that the Underlying Stock may experience difficulties collecting accounts receivable, sales and demand for the Underlying Stock's products may decrease, and the Underlying Stock's operating results may be adversely affected. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST LCID ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to risks of the automotive sector. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock has a limited operating history and evaluating its prospects is difficult. The Underlying Stock has incurred net losses each year since its inception and is expected to suffer substantial losses in the coming future. It has limited control over substantial costs associated with its operations. The automotive sector industry can be highly cyclical, and companies in the industry may suffer periodic operating losses. Automotive companies can be significantly affected by labor relations and fluctuating component prices. Governmental policies affecting the automotive industry, such as taxes, tariffs, duties, subsidies, and import and export restrictions on automotive products can influence industry profitability. In addition, such companies must comply with environmental laws and regulations, for which there may be severe consequences for non-compliance.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST LLY ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the healthcare sector and pharmaceutical industry. The profitability of companies in the healthcare sector may be affected by extensive, costly and uncertain government regulation, restrictions on government reimbursement for medical expenses, rising costs of medical products and services, pricing pressure (including price discounting), changes in the demand for medical products and services, an increased emphasis on outpatient services, limited product lines, industry innovation and/or consolidation, changes in technologies and other market developments. Many healthcare companies are heavily dependent on obtaining and defending patents, which may be time consuming and costly. The expiration of patents may adversely affect the profitability of these companies. Many healthcare companies are subject to extensive litigation based on product liability and similar claims. In addition, their products can become obsolete due to industry innovation, changes in technologies or other market developments. Many new products in the health care sector require significant research and development and may be subject to regulatory approvals, all of which may be time consuming and costly with no guarantee that any product will come to market.

The profitability of pharmaceutical companies is highly dependent on the development, procurement and marketing of drugs and the development, protection and exploitation of intellectual property rights and other proprietary information. These companies may be significantly affected by the expiration of patents or the loss of, or the inability to enforce, intellectual property rights. Research and other costs associated with developing or procuring new drugs and the related intellectual property rights can be significant and may not be successful. Many pharmaceutical companies face intense competition from new products and less costly generic products, which may make it difficult to raise the prices of their products and may result in price discounting. In addition, the process for obtaining regulatory approval from the U.S. Food and Drug Administration or other governmental regulatory authorities is long and costly and there is no assurance that the necessary approvals will be obtained or maintained by these companies.

These companies may be adversely affected by government regulation and changes in reimbursement rates from third-party payors, such as Medicare, Medicaid and other government-sponsored programs, private health insurance plans and health maintenance organizations. The profitability of these companies may be dependent on a relatively limited number of products. Additionally, their products can become obsolete due to industry innovation, changes in technologies or other market developments.

The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST MARA ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the electronic data processing industry. Any data breaches, unauthorized access, data loss due to system malfunctions, cyberattacks, privacy violations, data integrity issues, system outages, hardware failures, software vulnerabilities, human error, and power disruptions; essentially, any threat that could compromise the confidentiality, integrity, or availability of stored or processed data could have a material adverse effect on the Underlying Stock, its prospects and financial performance. Worldwide economic conditions could have an effect on the demand for the Underlying Stock's services and products and could result in declining revenue and earnings. General economic declines or a softening of the economy make it more likely that the Underlying Stock may experience difficulties collecting accounts receivable, sales and demand for the Underlying Stock's products may decrease, and the Underlying Stock's operating results may be adversely affected. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters.

Bitcoin Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to risks associated with bitcoin. Investing in bitcoin exposes to significant risks that are not typically present in other investments. These risks include the uncertainty surrounding new technology, limited evaluation due to bitcoin's short trading history, and the potential decline in adoption and value over the long term. The extreme volatility of bitcoin's price is also a risk factor. Regulatory uncertainties, such as potential government interventions and conflicting regulations across jurisdictions, can impact the demand for bitcoin and restrict its usage. Bitcoin is not presently widely accepted as a medium of exchange, which may be due to a number of common impediments and/or disadvantages to adopting the Bitcoin Network as a payment network, including the slowness of transaction processing and finality, variability of transaction fees, and volatility of the price of bitcoin. Additionally, risks associated with the sale of newly mined bitcoin, bitcoin trading platforms, competition from alternative digital assets, mining operations, network modifications, and intellectual property claims pose further challenges to bitcoin-linked investments. The value of bitcoin has been, may continue to be, substantially dependent on speculation, such that trading and investing in these assets generally may not be based on fundamental analysis. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Bitcoin Halving. While bitcoin prices have historically increased around halving events (a process designed to control the overall supply and reduce the risk of inflation in bitcoin, which uses a proof-of-work consensus algorithm and results in the mining reward being cut in half), there is no guarantee that the price change will be favorable or would compensate for the reduction in mining rewards. If a corresponding and proportionate increase in the price of bitcoin does not follow future halving events, the revenue the Underlying Stock earns from its bitcoin mining operations would see a decrease, which could have a material adverse effect on the Underlying Stock's results of operations and financial condition.

Hash Rate and Difficulty. As demand for bitcoin has increased, the global network hash rate (i.e., the aggregate amount of computing power devoted to supporting the bitcoin blockchain at a given time) has increased rapidly, and as greater adoption of bitcoin occurs, it is expected that demand for new bitcoin will likewise increase as more mining companies are drawn into the industry by this increased demand. Further, as a greater number of increasingly powerful miners have been deployed, the network difficulty for bitcoin has consequently also increased. A high difficulty means that more computing power will be required in order to solve a block and earn a new bitcoin reward, which, in turn, makes the bitcoin network more secure by limiting the possibility of one miner or mining pool gaining control of the network. Therefore, as new and existing miners deploy additional hash rate, the global network hash rate will continue to increase, meaning a miner's share of the global network hash rate (and therefore its chance of earning bitcoin rewards) will decline if it fails to deploy additional hash rate at pace with the industry. If an effort to grow the hash rate results in the inability to complete planned expansions on schedule and within anticipated cost estimates, deployment of newly purchased miners may be delayed, which could affect its competitiveness and results of operation, which could have a material adverse effect on the Underlying Stock's financial condition and market price for its securities.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST META ETF.

Underlying Stock Risk — The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the social media and computer programming industry. Such companies provide social networking, file sharing, and other web-based media applications. The risks related to investing in such companies include disruption in service caused by hardware or software failure, interruptions or delays in service by third-party data center hosting facilities and maintenance providers, security breaches involving certain private, sensitive, proprietary and confidential information managed and transmitted by social media companies, and privacy concerns and laws, evolving Internet regulation and other foreign or domestic regulations that may limit or otherwise affect the operations of such companies. Additionally, the collection of data from consumers and other sources could face increased scrutiny as regulators consider how the data is collected, stored, safeguarded and used. Furthermore, the business models employed by the companies in the social media and computer programming industries may not prove to be successful.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST MRVL ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the semiconductor industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock performance may be affected by global markets and demand for its products and services, its ability to develop new products and services, inventory levels, supply chain issues, the performance of third-party software developers, system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the semiconductor industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST MSFT ETF.

Underlying Stock Risk — The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the software and information technology industry. The value of stocks of information technology companies and companies that rely heavily on technology is particularly vulnerable to rapid changes in technology product cycles, rapid product obsolescence, government regulation, and competition, both domestically and internationally, including competition from competitors with lower production costs. In addition, many information technology companies have limited product lines, markets, financial resources or personnel. The prices of information technology companies and companies that rely heavily on technology, especially those of smaller, less-seasoned companies, tend to be more volatile and less liquid than the overall market. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the information technology industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST MSTR ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the software and information technology industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers of natural disasters. The Underlying Stock performance may be affected by global markets and demand for its products and services, its ability to develop new products and services, inventory levels, supply chain issues, the performance of third-party software developers, system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Bitcoin is not presently widely accepted as a medium of exchange, which may be due to a number of common impediments and/or disadvantages to adopting the Bitcoin Network as a payment network, including the slowness of transaction processing and finality, variability of transaction fees, and volatility of the price of bitcoin. Additionally, risks associated with the sale of newly mined bitcoin, bitcoin trading platforms, competition from alternative digital assets, mining operations, network modifications, and intellectual property claims pose further challenges to bitcoin-linked investments. The value of bitcoin has been, may continue to be, substantially dependent on speculation, such that trading and investing in these assets generally may not be based on fundamental analysis. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Bitcoin Halving. While bitcoin prices have historically increased around halving events (a process designed to control the overall supply and reduce the risk of inflation in bitcoin, which uses a proof-of-work consensus algorithm and results in the mining reward being cut in half) there is no guarantee that the price change will be favorable or would compensate for the reduction in mining rewards. If a corresponding and proportionate increase in the price of Bitcoin does not follow future halving events, the revenue the Underlying Stock earns from its bitcoin mining operations would see a decrease, which could have a material adverse effect on the Underlying Stock's results of operations and financial condition.

Hash Rate and Difficulty. As demand for bitcoin has increased, the global network hash rate (i.e., the aggregate amount of computing power devoted to supporting the bitcoin blockchain at a given time) has increased rapidly, and as greater adoption of bitcoin occurs, it is expected that demand for new bitcoin will likewise increase as more mining companies are drawn into the industry by this increased demand. Further, as a greater number of increasingly powerful miners have been deployed, the network difficulty for bitcoin has consequently also increased. A high difficulty means that more computing power will be required in order to solve a block and earn a new bitcoin reward, which, in turn, makes the bitcoin network more secure by limiting the possibility of one miner or mining pool gaining control of the network. Therefore, as new and existing miners deploy additional hash rate, the global network hash rate will continue to increase, meaning a miner's share of the global network hash rate (and therefore its chance of earning bitcoin rewards) will decline if it fails to deploy additional hash rate at pace with the industry. If an effort to grow the hash rate, results in the inability to complete planned expansions on schedule and within anticipated cost estimates, deployment of newly purchased miners may be delayed, which could affect its competitiveness and results of operation, which could have a material adverse effect on the Underlying Stock's financial condition and market price for its securities.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST MU ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the semiconductor industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock performance may be affected by global markets and demand for its products and services, its ability to develop new products and services, inventory levels, supply chain issues, the performance of third-party software developers, system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the semiconductor industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST NBIS ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the electronic data processing industry. Any data breaches, unauthorized access, data loss due to system malfunctions, cyberattacks, privacy violations, data integrity issues, system outages, hardware failures, software vulnerabilities, human error, and power disruptions; essentially, any threat that could compromise the confidentiality, integrity, or availability of stored or processed data could have a material adverse effect on the Underlying Stock, its prospects and financial performance. Worldwide economic conditions could have an effect on the demand for the Underlying Stock's services and products and could result in declining revenue and earnings. General economic declines or a softening of the economy make it more likely that the Underlying Stock may experience difficulties collecting accounts receivable, sales and demand for the Underlying Stock's products may decrease, and the Underlying Stock's operating results may be adversely affected. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST NFLX ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to to the risks of the software and information technology as well as the entertainment industries. The software and information technology industry is particularly vulnerable to rapid changes in technology product cycles, rapid product obsolescence, government regulation, and competition, both domestically and internationally, including competition from competitors with lower production costs. In addition, many information technology companies have limited product lines, markets, financial resources or personnel. The prices of information technology companies and companies that rely heavily on technology, especially those of smaller, less-seasoned companies, tend to be more volatile and less liquid than the overall market. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the information technology industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel. The entertainment industry is highly competitive and relies on consumer spending and the availability of disposable income for success. The prices of the securities of companies in the entertainment industry may fluctuate widely due to competitive pressures, heavy expenses incurred for research and development of products, problems related to bringing products to market, consumer preferences and rapid obsolescence of products. Legislative or regulatory changes and increased government supervision also may affect companies in the entertainment industry. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST NVDA ETF.

Underlying Stock Risk — The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the semiconductor industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk and the risk of natural disasters. The Underlying Stock performance may be affected by the Underlying Stock's ability to identify new products, technologies or services, global competition and business conditions, its dependence on third-party product manufacturers, product defect issues, cybersecurity breaches, and customer concentration. The Underlying Stock may also be affected by risks that affect the broader technology sector, including: government regulation; dramatic and often unpredictable changes in growth rates and competition for qualified personnel; heavy dependence on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability; and a small number of companies representing a large portion of the technology sector as a whole. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST NVO ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the healthcare sector and pharmaceutical industry. The profitability of companies in the healthcare sector may be affected by extensive, costly and uncertain government regulation, restrictions on government reimbursement for medical expenses, rising costs of medical products and services, pricing pressure (including price discounting), changes in the demand for medical products and services, an increased emphasis on outpatient services, limited product lines, industry innovation and/or consolidation, changes in technologies and other market developments. Many healthcare companies are heavily dependent on obtaining and defending patents, which may be time consuming and costly. The expiration of patents may adversely affect the profitability of these companies. Many healthcare companies are subject to extensive litigation based on product liability and similar claims. In addition, their products can become obsolete due to industry innovation, changes in technologies or other market developments. Many new products in the health care sector require significant research and development and may be subject to regulatory approvals, all of which may be time-consuming and costly with no guarantee that any product will come to market.

The profitability of pharmaceutical companies is highly dependent on the development, procurement and marketing of drugs and the development, protection and exploitation of intellectual property rights and other proprietary information. These companies may be significantly affected by the expiration of patents or the loss of, or the inability to enforce, intellectual property rights. Research and other costs associated with developing or procuring new drugs and the related intellectual property rights can be significant and may not be successful. Many pharmaceutical companies face intense competition from new products and less costly generic products, which may make it difficult to raise the prices of their products and may result in price discounting. In addition, the process for obtaining regulatory approval from the U.S. Food and Drug Administration or other governmental regulatory authorities is long and costly and there is no assurance that the necessary approvals will be obtained or maintained by these companies.

These companies may be adversely affected by government regulation and changes in reimbursement rates from third-party payors, such as Medicare, Medicaid and other government-sponsored programs, private health insurance plans and health maintenance organizations. The profitability of these companies may be dependent on a relatively limited number of products. Additionally, their products can become obsolete due to industry innovation, changes in technologies or other market developments.

The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST OKLO ETF.

Underlying Stock Risk — The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of industrials sector and the electrical equipment industries. The electrical equipment industry can be significantly affected by general economic trends, including employment, economic growth, interest rates, and changes in commodity prices. Electrical equipment companies are subject to the risks of technical obsolescence, and their profitability may be affected by government regulation and spending, import controls and worldwide competition. Companies in these industries also can be adversely affected by liability for environmental damage, depletion of resources, and mandated expenditures for safety and pollution control. These factors may result in a material adverse impact on the Underlying Stock's portfolio securities and the performance of the Fund. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST RBLX ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the communication services and the entertainment industries. The performance of companies in the communication services industry may be affected by (without limitation) the following factors: industry competition, increasing governmental regulation, the ability to keep pace with technological advancement and scrutiny by public bodies. Technological innovations may reduce the utility of products and services of companies in the communication services sector and render them less competitive or obsolete over time. These companies may need to commit substantial capital investment to deal with increasing competition and to keep pace with technological enhancement in order to remain competitive. The entertainment industry is highly competitive and relies on consumer spending and the availability of disposable income for success. The prices of the securities of companies in the entertainment industry may fluctuate widely due to competitive pressures, heavy expenses incurred for research and development of products, problems related to bringing products to market, consumer preferences and rapid obsolescence of products. Legislative or regulatory changes and increased government supervision also may affect companies in the entertainment industry. Underlying Leveraged ETF used by the GraniteShares YieldBOOST RIOT ETF.

Underlying Stock Risk: The Underlying Stock's business is highly competitive and operates 24 hours a day, 7 days a week, on a global basis. The primary drivers of competition are demand for bitcoin, sufficient capital resources to acquire large quantities of high-quality miners, the ability to secure these miners from a limited number of suppliers on rapid delivery schedules, and the ability to execute on those miner deployments with the best-in-class mining infrastructure to generate the highest returns while incurring the lowest costs to mine. RIOT's inability to maintain or improve market share versus its competitors could negatively impact its financial results. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters.

Bitcoin Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to risks associated with bitcoin. Investing in bitcoin exposes investors to significant risks that are not typically present in other investments. These risks include the uncertainty surrounding new technology, limited evaluation due to bitcoin's short trading history, and the potential decline in adoption and value over the long term. The extreme volatility of bitcoin's price is also a risk factor. Regulatory uncertainties, such as potential government interventions and conflicting regulations across jurisdictions, can impact the demand for bitcoin and restrict its usage. Bitcoin is not presently widely accepted as a medium of exchange, which may be due to a number of common impediments and/or disadvantages to adopting the Bitcoin Network as a payment network, including the slowness of transaction processing and finality, variability of transaction fees, and volatility of the price of bitcoin. Additionally, risks associated with the sale of newly mined bitcoin, bitcoin trading platforms, competition from alternative digital assets, mining operations, network modifications, and intellectual property claims pose further challenges to bitcoin-linked investments. The value of bitcoin has been, and may continue to be, substantially dependent on speculation, such that trading and investing in these assets generally may not be based on fundamental analysis.

Bitcoin Halving. While bitcoin prices have historically increased around halving events (a process designed to control the overall supply and reduce the risk of inflation in bitcoin, which uses a proof-of-work consensus algorithm and results in the mining reward being cut in half) there is no guarantee that the price change will be favorable or would compensate for the reduction in mining rewards. If a corresponding and proportionate increase in the price of bitcoin does not follow future halving events, the revenue the Underlying Stock earns from its bitcoin mining operations would see a decrease, which could have a material adverse effect on the Underlying Stock's results of operations and financial condition.

Hash Rate and Difficulty. As demand for bitcoin has increased, the global network hash rate (i.e., the aggregate amount of computing power devoted to supporting the bitcoin blockchain at a given time) has increased rapidly, and as greater adoption of bitcoin occurs, it is expected that demand for new bitcoin will likewise increase as more mining companies are drawn into the industry by this increased demand. Further, as a greater number of increasingly powerful miners have been deployed, the network difficulty for bitcoin has consequently also increased. A high difficulty means that more computing power will be required in order to solve a block and earn a new bitcoin reward, which, in turn, makes the bitcoin network more secure by limiting the possibility of one miner or mining pool gaining control of the network. Therefore, as new and existing miners deploy additional hash rate, the global network hash rate will continue to increase, meaning a miner's share of the global network hash rate (and therefore its chance of earning bitcoin rewards) will decline if it fails to deploy additional hash rate at pace with the industry. If an effort to grow the hash rate results in the inability to complete planned expansions on schedule and within anticipated cost estimates, deployment of newly purchased miners may be delayed, which could affect its competitiveness and results of operation, which could have a material adverse effect on the Underlying Stock's financial condition and market price for its securities.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST RIVN ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to risks of the automotive sector. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock has a limited operating history and evaluating its prospects is difficult. The Underlying Stock has incurred net losses each year since its inception and is expected to suffer substantial losses in the future. It has limited control over substantial costs associated with its operations. The automotive industry can be highly cyclical, and companies in the industry may suffer periodic operating losses. Automotive companies can be significantly affected by labor relations and fluctuating component prices. Governmental policies affecting the automotive industry, such as taxes, tariffs, duties, subsidies, and import and export restrictions on automotive products can influence industry profitability. In addition, such companies must comply with environmental laws and regulations, for which there may be severe consequences for non-compliance.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST Semiconductor ETF.

Industry Concentration Risk — The NYSE Semiconductor Index may have a significant portion of its value in issuers in an industry or group of industries. The Underlying Leveraged ETF will allocate its investments to approximately the same extent as the NYSE Semiconductor Index. As a result, the Underlying Leveraged ETF may be subject to greater market fluctuations than a fund that is more broadly invested across industries. As of August 21, 2025, the NYSE Semiconductor Index was comprised of 30 constituents which had a median market capitalization of $74.3 billion, and capitalizations ranging from $12.5 billion to $5.4 trillion and were concentrated in the semiconductor industry, which is included in the information technology sector with exposure to companies involved in artificial intelligence and big data. The NYSE Semiconductor Index is rebalanced quarterly and reconstituted annually.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST Small Cap ETF.

Industry Concentration Risk — The Russell 2000® Index may have a significant portion of its value in issuers in an industry or group of industries. The Underlying Leveraged ETF will allocate its investments to approximately the same extent as the Russell 2000® Index. As a result, the Underlying Leveraged ETF may be subject to greater market fluctuations than a fund that is more broadly invested across industries. As of September 30, 2026, the Russell 2000® Index consisted of 1,974 holdings, which had a median market capitalization of $1.1 billion, total market capitalizations ranging from $340 million to $12.6 billion and were concentrated in the healthcare, and industrials sectors. The Russell 2000® Index is reconstituted annually and enhanced by initial public offerings quarterly.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST SMCI ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the software and information technology industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock performance may be affected by significant customer losses, its inability to develop and implement new technologies, its reliance on third-party distributors and platforms, cybersecurity attacks, its inability to protect its intellectual property rights and global laws and regulations affecting privacy, data protection and technology protections.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST SMR ETF.

Underlying Stock Risk — The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of industrials sector and electrical equipment industries. The electrical equipment industry can be significantly affected by general economic trends, including employment, economic growth, interest rates, and changes in commodity prices. Electrical equipment companies are subject to the risks of technical obsolescence, and their profitability may be affected by government regulation and spending, import controls and worldwide competition. Companies in these industries also can be adversely affected by liability for environmental damage, depletion of resources, and mandated expenditures for safety and pollution control. These factors may result in a material adverse impact on the Fund's portfolio securities and the performance of the Fund. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST SOFI ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the consumer finance industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but are not limited to changes in economic conditions, demand for consumer loans, and refinancing activity. Profitability can be largely dependent on the availability and cost of capital and the rate of consumer debt defaults, and can fluctuate significantly when interest rates change. Financial difficulties of borrowers can negatively affect the consumer finance industry. Companies in the consumer finance industry are subject to extensive government regulation, which can change frequently and may adversely affect the scope of their activities, the prices they can charge and the amount of capital they must maintain, or may affect them in other ways that are unforeseeable. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters.

Industry Concentration Risk — The S&P 500® index may have a significant portion of its value in issuers in an industry or group of industries. The Underlying Leveraged ETF will allocate its investments to approximately the same extent as the S&P 500® index. As a result, the Underlying Leveraged ETF may be subject to greater market fluctuations than a fund that is more broadly invested across industries. As of September 30, 2026, the S&P 500® index consisted of 503 constituents, which had an average total market capitalization of $136.1 billion, total market capitalizations ranging from $4.2 billion to $4.3 trillion and were concentrated in the information technology sector. The S&P 500® index is rebalanced quarterly.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST Technology ETF.

Industry Concentration Risk — The Technology Select Sector Index may have a significant portion of its value in issuers in an industry or group of industries. The Underlying Leveraged ETF will allocate its investments to approximately the same extent as the Technology Select Sector Index. As a result, the Underlying Leveraged ETF may be subject to greater market fluctuations than a fund that is more broadly invested across industries. As of September 30, 2026, the Technology Select Sector Index was comprised of 84 constituents with a median market capitalization of $77.0 billion, total market capitalizations ranging from $11.9 billion to $5.2 trillion and were concentrated in the information technology sector. The Technology Select Sector Index is rebalanced quarterly.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST TEM ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the information technology and computer programming industries. The information technology industry includes companies engaged in internet software and services, technology hardware and storage peripherals, electronic equipment instruments and components, and semiconductors and semiconductor equipment. Information technology companies face intense competition, both domestically and internationally, which may have an adverse effect on profit margins. Information technology companies may have limited product lines, markets, financial resources or personnel. The products of information technology companies may face rapid product obsolescence due to technological developments and frequent new product introduction, unpredictable changes in growth rates and competition for the services of qualified personnel. Failure to introduce new products, develop and maintain a loyal customer base, or achieve general market acceptance for their products could have a material adverse effect on a company's business. Companies in the information technology sector are heavily dependent on intellectual property, and the loss of patent, copyright and trademark protections may adversely affect the profitability of these companies. Companies in the computer programming industry provide social networking, file sharing, and other web-based media applications. The risks related to investing in such companies include disruption in service caused by hardware or software failure, interruptions or delays in service by third-party data center hosting facilities and maintenance providers, security breaches involving certain private, sensitive, proprietary and confidential information managed and transmitted by social media companies, and privacy concerns and laws, evolving Internet regulation and other foreign or domestic regulations that may limit or otherwise affect the operations of such companies. Additionally, the collection of data from consumers and other sources could face increased scrutiny as regulators consider how the data is collected, stored, safeguarded and used. Furthermore, the business models employed by the companies are in the computer programming industries. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST TSLA ETF.

Industry Concentration Risk — The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to risks of the automotive industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk and the risk of natural disasters. The Underlying Stock performance may be affected by the company's ability to develop and launch new products, the growth of its sales and delivery capabilities, part supplier constraints or delays, consumer demand for electric vehicles and competition from existing and new competitors. Governmental policies affecting the automotive industry, such as taxes, tariffs, duties, subsidies, and import and export restrictions on automotive products can influence industry profitability. In addition, such companies must comply with environmental laws and regulations, for which there may be severe consequences for non-compliance. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the semiconductor industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Underlying Stock performance may be affected by global markets and demand for its products and services, its ability to develop new products and services, inventory levels, supply chain issues, the performance of third-party software developers, system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the semiconductor industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Fund's performance, is subject to the risks of the healthcare industry. The profitability of companies in the healthcare industry may be affected by extensive, costly and uncertain government regulation, restrictions on government reimbursement for medical expenses, rising costs of medical products and services, pricing pressure (including price discounting), changes in the demand for medical products and services, an increased emphasis on outpatient services, limited product lines, industry innovation and/or consolidation, changes in technologies and other market developments. Many healthcare companies are heavily dependent on obtaining and defending patents, which may be time consuming and costly. The expiration of patents may adversely affect the profitability of these companies. Many healthcare companies are subject to extensive litigation based on product liability and similar claims. In addition, their products can become obsolete due to industry innovation, changes in technologies or other market developments. Many new products in the health care sector require significant research and development and may be subject to regulatory approvals, all of which may be time-consuming and costly with no guarantee that any product will come to market. These companies may be adversely affected by government regulation and changes in reimbursement rates from third-party payors, such as Medicare, Medicaid and other government-sponsored programs, private health insurance plans and health maintenance organizations. The profitability of these companies may be dependent on a relatively limited number of products. Additionally, their products can become obsolete due to industry innovation, changes in technologies or other market developments. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters. The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the financial services industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but are not limited to government regulations, economic conditions, credit rating downgrades, changes in interest rates and decreased liquidity in credit markets. Profitability of these companies is largely dependent on the availability and cost of capital and can fluctuate significantly when interest rates change. Credit losses resulting from financial difficulties of borrowers also can negatively impact the sector. These companies are also subject to substantial government regulation and intervention, which may adversely impact the scope of their activities, the prices they can charge, the amount of capital they must maintain, and potentially, their size. The Underlying Stock performance may be affected by system and network failures, privacy and cybersecurity breaches and changes in international and government regulations. Information technology companies are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. Additionally, companies in the financial services sector and the insurance industry may face dramatic and often unpredictable changes in growth rates and competition for the services of qualified personnel. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters.

Underlying Leveraged ETF used by the GraniteShares YieldBOOST VRT ETF.

Underlying Stock Risk: The performance of the Underlying Stock, and consequently the Underlying Leveraged ETF's performance, is subject to the risks of the industrial machinery industry. The Underlying Stock is subject to many risks that can negatively impact its revenue and viability including, but are not limited to the availability and prices of raw materials, components, products and services from third-party suppliers, and such suppliers' ability to timely deliver the quantities and quality required at reasonable prices could have a material adverse effect on our company, its prospects and financial performance. Worldwide economic conditions could have an effect on the demand for our company's services and products and could result in declining revenue and earnings. General economic declines or a softening of the economy make it more likely that our company may experience difficulties collecting accounts receivable, sales and demand for our company's products may decrease, and our company's operating results may be adversely affected. The Underlying Stock is subject to general market risks that can negatively impact its revenue and viability including, but not limited to price volatility risk, management risk, inflation risk, global economic risk, growth risk, supply and demand risk, operations risk, regulatory risk, environmental risk, terrorism risk, embargoes, tariffs, sanctions, other trade barriers and the risk of natural disasters.

The Fund's daily returns may be affected by many factors but will depend on the performance and volatility of the Underlying Stock.

Counterparty Risk *(All Funds)*: Each Fund is subject to counterparty risk by virtue of its investments in options contracts. Transactions in some types of derivatives, including options, are required to be centrally cleared ("cleared derivatives"). In a transaction involving cleared derivatives, a Fund's counterparty is a clearing house rather than a bank or broker. Since the Funds are not members of clearing houses and only members of a clearing house ("clearing members") can participate directly in the clearing house, the Funds will hold cleared derivatives through accounts at clearing members. In cleared derivatives positions, a Fund will make payments (including margin payments) to and receive payments from a clearing house through their accounts at clearing members. Customer funds held at a clearing organization in connection with any options contracts are held in a commingled omnibus account and are not identified to the name of the clearing member's individual customers. As a result, assets deposited by a Fund with any clearing member as margin for options may, in certain circumstances, be used to satisfy losses of other clients of a Fund's clearing member. In addition, although clearing members guarantee performance of their clients' obligations to the clearing house, there is a risk that the assets of a Fund might not be fully protected in the event of the clearing member's bankruptcy, as a Fund would be limited to recovering only a pro rata share of all available funds segregated on behalf of the clearing member's customers for the relevant account class. Each Fund is also subject to the risk that a limited number of clearing members are willing to transact on the Fund's behalf, which heightens the risks associated with a clearing member's default. If a clearing member defaults a Fund could lose some or all of the benefits of a transaction entered into by the Fund with the clearing member. If a Fund cannot find a clearing member to transact with on the Fund's behalf, the Fund may be unable to effectively implement its investment strategy.

In addition, a counterparty (the other party to a transaction or an agreement or the party with whom the Fund executes transactions) to a transaction (including repurchase transaction) with the Fund may be unable or unwilling to make timely principal, interest or settlement payments, or otherwise honor its obligations.

Derivatives Risk *(All Funds)*: The Funds' derivative investments have risks, including the imperfect correlation between the value of such instruments and the underlying assets; the loss of principal, including the potential loss of amounts greater than the initial amount invested in the derivative instrument; the possible default of the other party to the transaction; and illiquidity of the derivative investments. Use of derivatives could also result in a loss if the counterparty to the transaction does not perform as promised, including because of such counterparty's bankruptcy or insolvency. This risk may be greater during volatile market conditions. Other risks include the inability to close out a position because the trading market becomes illiquid (particularly in the OTC markets) or the availability of counterparties becomes limited for a period of time. In addition, the presence of speculators in a particular market could lead to price distortions.

Certain of the Funds' transactions in derivatives could also affect the amount, timing, and character of distributions to shareholders, which may result in a Fund realizing more short-term capital gain and ordinary income subject to tax at ordinary income tax rates than it would if it did not engage in such transactions, which may adversely impact such Fund's after-tax returns.

In addition, each Fund's investments in derivatives are subject to the following risks:

Options Contracts. The use of options contracts involves investment strategies and risks different from those associated with ordinary portfolio securities transactions. The prices of options are volatile and are influenced by, among other things, actual and anticipated changes in the value of the underlying instrument, including the anticipated volatility, which are affected by fiscal and monetary policies and by national and international political, changes in the actual or implied volatility or the reference asset, the time remaining until the expiration of the option contract and economic events. For each of the Funds, the value of the options contracts in which the Fund invests is substantially influenced by the value of the applicable Underlying Leveraged ETF. Selling put options exposes the Funds to the risk of potential loss if the market value of its Underlying Leveraged ETF falls below the strike price before the option expires. The Funds may experience substantial downside from specific option positions and certain option positions held by a Fund may expire worthless. The options held by the Funds are exercisable at the strike price on their expiration date. As an option approaches its expiration date, its value typically increasingly moves with the value of the underlying instrument. However, prior to such date, the value of an option generally does not increase or decrease at the same rate at the underlying instrument. There may at times be an imperfect correlation between the movement in values of options contracts and the reference asset, and there may at times not be a liquid secondary market for certain options contracts. The value of the options held by the Funds will be determined based on market quotations or other recognized pricing methods. Additionally, the Fund's practice of rolling may cause the Fund to experience losses if the expiring contracts do not generate proceeds enough to cover the costs of entering into new options contracts. Further, if an option is exercised, the seller (writer) of a put option is obligated to purchase the underlying asset at the strike price, which can result in significant financial and regulatory obligations for the Fund if the market value of the asset has fallen substantially. Furthermore, when the Fund seeks to trade out of puts, especially near expiration, there is an added risk that the Fund may be required to allocate resources unexpectedly to fulfill these obligations. This potential exposure to physical settlement can significantly impact the Fund's liquidity and market exposure, particularly in volatile market conditions.

Swap Risk: Swaps are subject to tracking risk because they may not be perfect substitutes for the instruments they are intended to hedge or replace. Over the counter swaps are subject to counterparty default. Leverage inherent in derivatives will tend to magnify the Fund's losses. The swap agreements may reference standardized exchange-traded, FLEX, European Style or American Style put options contracts that are based on the values of the price returns of the Underlying Leveraged ETF. that generate specific risks.

Affiliated Fund Risk. In managing each Fund, the Adviser has the ability to select the Underlying Leveraged ETF and substitute the Underlying Leveraged ETF with other ETFs that it believes will achieve the Fund's objective. The Adviser may be subject to potential conflicts of interest in selecting the Underlying Leveraged ETF and substituting the Underlying Leveraged ETF with other ETFs because the fees paid to the Adviser by some Underlying Leveraged ETF may be higher than the fees charged by other Underlying Leveraged ETF. Unaffiliated Underlying Leveraged ETF do not pay fee to the Adviser.

Distribution Risk. As part of the Funds' investment objectives, the Funds seek to provide current weekly income. There is no assurance that the Funds will make a distribution in any given week. If a Fund makes distributions, the amounts of such distributions will likely vary greatly from one distribution to the next. Additionally, weekly distributions, if any, may consist of returns of capital, which would decrease the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

ETF Risks.

Authorized Participants, Market Makers, and Liquidity Providers Concentration Risk. The Funds have a limited number of financial institutions that are authorized to purchase and redeem Shares directly from the Fund (known as "Authorized Participants" or "APs"). In addition, there may be a limited number of market makers and/or liquidity providers in the marketplace. To the extent either of the following events occur, Shares may trade at a material discount to NAV and possibly face delisting: (i) APs exit the business or otherwise become unable to process creation and/or redemption orders and no other APs step forward to perform these services; or (ii) market makers and/or liquidity providers exit the business or significantly reduce their business activities and no other entities step forward to perform their functions.

Cash Redemption Risk. Each Fund currently expects to effect a significant portion of its creations and redemptions for cash, rather than in-kind securities. Paying redemption proceeds in cash rather than through in-kind delivery of portfolio securities may require the Fund to dispose of or sell portfolio securities or other assets at an inopportune time to obtain the cash needed to meet redemption orders. This may cause the Fund to sell a security and recognize a capital gain or loss that might not have been incurred if it had made a redemption in-kind. As a result, the Fund may pay out higher or lower annual capital gains distributions than ETFs that redeem in-kind. The use of cash creations and redemptions may also cause the Fund's Shares to trade in the market at greater bid-ask spreads or greater premiums or discounts to the Fund's NAV. Furthermore, the Fund may not be able to execute cash transactions for creation and redemption purposes at the same price used to determine the Fund's NAV. To the extent that the maximum additional charge for creation or redemption transactions is insufficient to cover the execution shortfall, the Fund's performance could be negatively impacted.

Costs of Buying or Selling Shares. Due to the costs of buying or selling Shares, including brokerage commissions imposed by brokers and bid-ask spreads, frequent trading of Shares may significantly reduce investment results and an investment in Shares may not be advisable for investors who anticipate regularly making small investments.

Shares May Trade at Prices Other Than NAV. As with all ETFs, Shares may be bought and sold in the secondary market at market prices. Although it is expected that the market price of Shares will approximate the Fund's NAV, there may be times when the market price of Shares is more than the NAV intra-day (premium) or less than the NAV intra-day (discount) due to supply and demand of Shares or during periods of market volatility. This risk is heightened in times of market volatility, periods of steep market declines, and periods when there is limited trading activity for Shares in the secondary market, in which case such premiums or discounts may be significant.

Trading. Although Shares are listed on a national securities exchange, such as the applicable Exchange, and may be traded on U.S. exchanges other than the applicable Exchange, there can be no assurance that an active trading market for the Shares will develop or be maintained or that the Shares will trade with any volume, or at all, on any stock exchange. This risk may be greater for the Funds as they seek to have exposure to a single underlying stock as opposed to a more diverse portfolio like a traditional pooled investment. In stressed market conditions, the liquidity of Shares may begin to mirror the liquidity of a Fund's underlying portfolio holdings, which can be significantly less liquid than Shares. Shares trade on the applicable Exchange at a market price that may be below, at or above a Fund's NAV. Trading in Shares on the applicable Exchange may be halted due to market conditions or for reasons that, in the view of the Exchange, make trading in Shares inadvisable. In addition, trading in Shares on an Exchange is subject to trading halts caused by extraordinary market volatility pursuant to the applicable Exchange's "circuit breaker" rules. There can be no assurance that the requirements of the applicable Exchange necessary to maintain the listing of a Fund will continue to be met or will remain unchanged. In the event of an unscheduled market close for options contracts that reference a single stock, such as the Underlying Leveraged ETF's securities being halted or a market wide closure, settlement prices will be determined by the procedures of the listing exchange of the options contracts. As a result, a Fund could be adversely affected and be unable to implement its investment strategies in the event of an unscheduled closing.

High Portfolio Turnover Risk. The Funds may actively and frequently trade all or a significant portion of the securities in their portfolio. A high portfolio turnover rate increases transaction costs, which may increase a Fund's expenses. Frequent trading may also cause adverse tax consequences for investors in the Funds due to an increase in short-term capital gains.

Inflation Risk. Inflation risk is the risk that the value of assets or income from investments will be less in the future as inflation decreases the value of money. As inflation increases, the present value of the Fund's assets and distributions, if any, may decline.

Liquidity Risk. Some securities held by the Funds, including options contracts, may be difficult to sell or be illiquid, particularly during times of market turmoil. This risk is greater for each Fund as it will hold options contracts on a single security, and not a broader range of options contracts. Markets for securities or financial instruments could be disrupted by a number of events, including, but not limited to, an economic crisis, natural disasters, epidemics/pandemics, new legislation or regulatory changes inside or outside the United States. Illiquid securities may be difficult to value, especially in changing or volatile markets. If a Fund is forced to sell an illiquid security at an unfavorable time or price, such Fund may be adversely impacted. Certain market conditions or restrictions, such as market rules related to short sales, may prevent a Fund from limiting losses, realizing gains or achieving a high correlation with the applicable Underlying Leveraged ETF. There is no assurance that a security that is deemed liquid when purchased will continue to be liquid. Market illiquidity may cause losses for the Funds.

Management Risk. Each Fund is subject to management risk because it is an actively managed portfolio. In managing each Fund's investment portfolio, the portfolio managers will apply investment techniques and risk analyses that may not produce the desired result. There can be no guarantee that a Fund will meet its investment objective.

Money Market Instrument Risk. The Funds may use a variety of money market instruments for cash management purposes, including money market funds, depositary accounts and repurchase agreements. Repurchase agreements are contracts in which a seller of securities agrees to buy the securities back at a specified time and price. Repurchase agreements may be subject to market and credit risk related to the collateral securing the repurchase agreement. Money market instruments, including money market funds, may lose money through fees or other means.

NAV Erosion Risk Due to Distributions. If a Fund makes a distribution, the Fund's NAV will typically drop by the amount of the distribution on the related ex-dividend date. The repeated payment of distributions, if any, by a Fund may significantly erode the Fund's NAV and trading price over time. As a result, an investor may suffer significant losses to their investment.

New Fund Risk. Each Fund is recently organized with no or limited operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions. There can be no assurance that the Funds will grow to or maintain an economically viable size.

Non-Diversification Risk. Because each Fund is "non-diversified," a Fund may invest a greater percentage of its assets in the securities of a single issuer or a smaller number of issuers than if it was a diversified fund. As a result, a decline in the value of an investment in a single issuer or a smaller number of issuers could cause a Fund's overall value to decline to a greater degree than if such Fund held a more diversified portfolio. This may increase the Fund's volatility and have a greater impact on such Fund's performance.

Operational Risk. Each Fund is subject to risks arising from various operational factors, including, but not limited to, human error, processing and communication errors, errors of the Funds' service providers, counterparties or other third-parties, failed or inadequate processes and technology or systems failures. Each Fund relies on third-parties for a range of services, including custody. Any delay or failure relating to engaging or maintaining such service providers may affect a Fund's ability to meet its investment objective. Although the Funds and the Adviser seek to reduce these operational risks through controls and procedures, there is no way to completely protect against such risks.

Price Participation Risk. Each Fund employs an investment strategy that includes the sale of in-the-money put options contracts, which limits the degree to which the Fund will participate in increases in value experienced by its reference Underlying Leveraged ETF over the Call Period. This means that if the Underlying Leveraged ETF experiences an increase in value above the strike price of the sold put options during a Call Period, the Fund will likely not experience that increase to the same extent and may significantly underperform the Underlying Leveraged ETF over the Call Period. Additionally, because the Fund is limited in the degree to which it will participate in increases in value experienced by the reference Underlying Leveraged ETF over each Call Period, but has full exposure to any decreases in value experienced by the Underlying Leveraged ETF over the Call Period, the NAV of the Fund may decrease over any given time period. The Fund's NAV is dependent on the value of each options portfolio, which is based principally upon the performance of the reference Underlying Leveraged ETF. The degree of participation in the Underlying Leveraged ETF gains the Fund will experience will depend on prevailing market conditions, especially market volatility, at the time the Fund enters into the sold put options contracts and will vary from Call Period to Call Period. The value of the options contracts is affected by changes in the value and dividend rates of the reference Underlying Leveraged ETF, changes in interest rates, changes in the actual or perceived volatility of the Underlying Leveraged ETF and the remaining time to the options' expiration, as well as trading conditions in the options market. As the price of the reference Underlying Leveraged ETF changes and time moves towards the expiration of each Call Period, the value of the options contracts, and therefore the Fund's NAV, will change. However, it is not expected for the Fund's NAV to directly correlate on a day-to-day basis with the returns of the Underlying Leveraged ETF. The amount of time remaining until the options contract's expiration date affects the impact of the potential options contract income on the Fund's NAV, which may not be in full effect until the expiration date of the Fund's options contracts. Therefore, while changes in the price of the Underlying Leveraged ETF will result in changes to the Fund's NAV, the Fund generally anticipates that the rate of change in the Fund's NAV will be different than that experienced by the reference Underlying Leveraged ETF.

Put Writing Strategy Risk. The path dependency (i.e., the continued use) of the Fund's put writing strategy will impact the extent that the Fund participates in the positive price returns of the Underlying Leveraged ETF and, in turn, the Fund's returns, both during the term of the sold put options and over longer time periods.

If, for example, the Fund were to sell 10% in-the-money put options having a one-month term, the Fund's participation in the positive price returns of the Underlying Leveraged ETF will be capped at 10% for that month. However, over a longer period (e.g., a three-month period), the Fund should not be expected to participate fully in the first 30% (i.e., 3 months x 10%) of the positive price returns of the Underlying Leveraged ETF, or the Fund may even lose money, even if the Underlying Leveraged ETF share price has appreciated by at least that much over such period, if during any particular month or months over that period the Underlying Leveraged ETF had a return less than 10%. This example illustrates that both the Fund's participation in the positive price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

If, for example, the Fund were to sell 5% out-of-the-money put options having a one-week term, the Fund's downward protection against the negative price returns of the Underlying Leveraged ETF will be capped at 5% for that week. However, over a longer period (e.g., a four-week period), the Fund should not be expected to be protected fully in the first 25% (i.e., 4 weeks x 5%) of the negative price returns of the Underlying Leveraged ETF, and the Fund may lose money, even if the Underlying Leveraged ETF share price has appreciated over such period, if during any particular week or weeks over that period the Underlying Leveraged ETF share price had decreases by more than 5%. This example illustrates that both the Fund's protection against the negative price returns of the Underlying Leveraged ETF and its returns will depend not only on the price of the Underlying Leveraged ETF but also on the path that the Underlying Leveraged ETF takes over time.

Under both cases the Fund may be fully exposed to the downward movements of the Underlying Leveraged ETF, offset only by the premiums received from selling put contracts. The Fund does not seek to offer any downside protection, except for the fact that the premiums from the sold options may offset some or all of the Underlying Leveraged ETF's decline.

Put Spread Strategy Risk. Similarly to a put writing strategy (see relevant risk factor), a put spread strategy will subject the Fund's performance to path dependency.

Option Market Liquidity Risk. The trading activity in the option market of the Underlying Leveraged ETF may be limited and the option contracts may trade at levels significantly different from their economic value. The lack of liquidity may negatively affect the ability of the Fund to achieve its investment objective. This risk may increase if the portfolio turnover is elevated, for instance because of frequent changes in the number of Shares outstanding, and if the net asset value of the Underlying Leveraged ETF is modest.

Concentration Risk. To the extent that the Underlying Leveraged ETF concentrates its investments in a particular industry, the Fund will be subject to the risks associated with that industry.

Recent Market Events Risk. U.S. and international markets have experienced significant periods of volatility in recent years and months due to a number of economic, political and global macro factors including the impact of COVID-19 as a global pandemic and related public health crisis, growth concerns in the U.S. and overseas, uncertainties regarding interest rates, rising inflation, trade tensions, and the threat of tariffs imposed by the U.S. and other countries. Conflict, loss of life and disaster connected to ongoing armed conflict between Ukraine and Russia in Europe and Israel and Hamas in the Middle East could have severe adverse effects on the region, including significant adverse effects on the regional or global economies and the markets for certain securities. The U.S. and the European Union have imposed sanctions on certain Russian individuals and companies, including certain financial institutions, and have limited certain exports and imports to and from Russia. The war has contributed to recent market volatility and may continue to do so. These developments, as well as other events, could result in further market volatility and negatively affect financial asset prices, the liquidity of certain securities and the normal operations of securities exchanges and other markets, despite government efforts to address market disruptions. As a result, the risk environment remains elevated. The Adviser will monitor developments and seek to manage the Funds in a manner consistent with achieving each Fund's investment objective, but there can be no assurance that it will be successful in doing so.

Significant market volatility and market downturns may limit the Funds' ability to obtain exposure on options on the Underlying Leveraged ETFs, and the Funds' activity may exacerbate the market volatility and downturn. Under such circumstances, a Fund may have difficulty achieving its investment objective for one or more trading days, which may adversely impact a Fund's returns on those days and periods inclusive of those days. Alternatively, a Fund may incur higher costs in order to achieve its investment objective and may be forced to purchase and sell securities (including other ETFs' shares) at market prices that do not represent their fair value (including in the case of an ETF, its NAV) or at times that result in differences between the price such Fund receives for the security and the market closing price of the security. Under those circumstances, a Fund's ability to track the applicable Underlying Leveraged ETF is likely to be adversely affected, the market price of Shares may reflect a greater premium or discount to NAV and bid-ask spreads in Shares may widen, resulting in increased transaction costs for secondary market purchasers and sellers.

Single Issuer Risk. Issuer-specific attributes may cause an investment in the Fund to be more volatile than a traditional pooled investment vehicle which diversifies risk or the market generally. The value of the Fund, which focuses on an individual Underlying Leveraged ETF, may be more volatile than a traditional pooled investment or the market as a whole and may perform differently from the value of a traditional pooled investment or the market as a whole.

Tax Risk. The Funds intend to elect and to qualify each year to be treated as a RIC under Subchapter M of the Code. As a RIC, each Fund will not be subject to U.S. federal income tax on the portion of its net investment income and net capital gain that it distributes to Shareholders, provided that it satisfies certain requirements of the Code. If a Fund does not qualify as a RIC for any taxable year and certain relief provisions are not available, the Fund's taxable income will be subject to tax at the Fund level and to a further tax at the shareholder level when such income is distributed. To comply with the asset diversification test applicable to a RIC, each Fund will attempt to ensure that the value of derivatives it holds is never 25% of the total value of Fund assets at the close of any quarter. If a Fund's investments in derivatives were to exceed 25% of the Fund's total assets at the end of a tax quarter, the Fund, generally, has a grace period to cure such lack of compliance. If a Fund fails to timely cure, it may no longer be eligible to be treated as a RIC. In addition, for a given Fund, the distributions received by the Fund from the Underlying Leveraged ETF may generate "bad income" that could prevent such Fund from meeting the "Income Requirement" of Subchapter M of the Code, which may cause the Fund to fail to qualify as a RIC.

Investing in U.S. Equities Risk. Investing in U.S. issuers subjects the Fund to legal, regulatory, political, currency, security, and economic risks that are specific to the U.S. Certain changes in the U.S., such as a weakening of the U.S. economy or a decline in its financial markets, may have an adverse effect on U.S. issuers.

Affiliated ETFs Risk: The Fund may invest in equity securities of other ETFs for which the Adviser serves as investment adviser. It is possible that a conflict of interest may arise. Additionally, to the extent the Fund invests in the securities of another affiliated ETF, the Fund will be subject to the investment risks of the ETF. Shareholders of the Fund are subject to duplicative expenses to the extent of the Fund's investment in any affiliated ETF. Finally, the shares of the ETFs in which the Fund may invest will be listed on a national securities exchange and the Fund will purchase or sell these shares on the secondary market at its current market price, which may be more or less than its net asset value per share.

Box Spread ETF Risk. The Fund may invest in LBOX, an affiliated ETF advised by GraniteShares Advisors LLC, the Fund's investment adviser, that employs a market-neutral box spread strategy to generate short-term, fixed-income-like returns. Box spread positions involve simultaneous long and short synthetic options positions on the same reference asset and are structured to capture an implied financing rate. While box spreads are designed to be market-neutral and to generate a return approximating prevailing short-term interest rates, they are subject to execution risk, counterparty risk with respect to the options positions, and the risk that the implied financing rate embedded in the box spread diverges from prevailing market rates in periods of market stress. The Fund's investments in LBOX are made pursuant to Section 12(d)(1)(G) of the 1940 Act, which imposes no percentage-of-assets limits on the Fund's investment in an exchange-traded fund. Accordingly, the Fund could, at any time, hold a material allocation in LBOX. The Fund's adviser faces a conflict of interest in allocating Fund assets to an affiliated fund such as LBOX; see "Affiliated ETFs Risk."

Fixed Income Securities Risk: The market value of Fixed Income Securities will change in response to interest rate changes and other factors, such as changes in the effective maturities and credit ratings of fixed income investments. During periods of falling interest rates, the values of outstanding Fixed Income Securities and related financial instruments generally rise. Conversely, during periods of rising interest rates, the values of such securities and related financial instruments generally decline. Fixed Income Securities are also subject to credit risk.

U.S. Government and U.S. Agency Obligations Risk. The Funds may invest in securities issued by the U.S. government or its agencies or instrumentalities. U.S. Government obligations include securities issued or guaranteed as to principal and interest by the U.S. Government, its agencies or instrumentalities, such as the U.S. Treasury. Payment of principal and interest on U.S. Government obligations may be backed by the full faith and credit of the United States or may be backed solely by the issuing or guaranteeing agency or instrumentality itself. In the latter case, the investor must look principally to the agency or instrumentality issuing or guaranteeing the obligation for ultimate repayment, which agency or instrumentality may be privately owned. There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) where it is not obligated to do so.

FUND WEBSITE AND DISCLOSURE OF PORTFOLIO HOLDINGS

The Trust maintains a website for the Funds at www.graniteshares.com. Among other things, this website includes each Fund's prospectus and Statement of Additional Information ("SAI"), and includes the Funds' holdings, the Funds' last annual and semi-annual reports, pricing information about shares trading on the Exchange, updated performance information, premiums and discounts, and bid/ask spreads. The Funds' annual and semi-annual reports contain complete listings of each Fund's portfolio holdings as of the end of the Funds' second and fourth fiscal quarters. Each Fund prepares a report on Form N-PORT of its portfolio holdings as of the end of each month. The Funds' annual and semi-annual reports are filed with the SEC within 60 days of the end of the reporting period and the Fund's monthly portfolio holdings are filed with the SEC within 60 days after the end of each fiscal quarter. You can find the SEC filings on the SEC's website, www.sec.gov. A summarized description of the GraniteShares Trust's policies and procedures with respect to the disclosure of Fund portfolio holdings is available in each Fund's SAI. Information on how to obtain the SAI is listed on the inside back cover of this prospectus.

FUND MANAGEMENT

Adviser

GraniteShares Advisors LLC, the investment adviser to Funds, is a Delaware limited liability company located at 250 Broadway, 24th Floor, New York, New York 10007. The Adviser provides investment advisory services to exchange-traded funds. The Adviser serves as investment adviser to the Funds with overall responsibility for the portfolio management of the Funds, subject to the supervision of the Board of the GraniteShares Trust. For its services, the Adviser receives a fee that is equal to 0.99% per annum of the average daily net assets of each Fund, in each case calculated daily and paid monthly.

Although each Fund is responsible for its own operating expenses, the Adviser has entered into an Expense Limitation Agreement with each Fund. Under this Expense Limitation Agreement, the Adviser has contractually agreed to waive its fees and/or pay for operating expenses of each Fund to ensure that total annual fund operating expenses (excluding interest, taxes, brokerage commissions, expenses related to short sales, other expenditures which are capitalized in accordance with generally accepted accounting principles, other extraordinary expenses not incurred in the ordinary course of a Fund's business, and amounts, if any, payable pursuant to a plan adopted in accordance with Rule 12b-1 under the 1940 Act)) will not exceed 1.15% of each Fund's average daily net assets. This Expense Limitation Agreement is effective until December 31, 2027, and it may be terminated before the date only by the Board. Any expense waiver or reimbursement is subject to recoupment by the Adviser within the three years after the expense was waived/reimbursed only if Total Annual Fund Operating Expenses fall below the lesser of this percentage limitation and any percentage limitation in place at the time the expense was waived/reimbursed.

The Adviser is a wholly owned subsidiary of GraniteShares, Inc., a Delaware corporation. The Adviser has been a registered investment adviser since 2017. As of September 30, 2026, the Adviser had US$ 10,500 million in total assets under management.

A discussion regarding the basis for the Board's approval of the investment advisory agreement with respect to each Fund is available in the Funds' Form N-CSR dated June 30, 2026.

Portfolio Managers

Jeff Klearman has been Portfolio Manager at GraniteShares since 2017. Mr. Klearman has over 20 years of experience working as a trader, structurer, marketer and researcher. Most recently, Mr. Klearman was the Chief Investment Officer for Rich Investment Services, a company which created, listed and managed ETFs. Prior to Rich Investment Services, Mr. Klearman headed the New York Commodities Structuring desk at Deutsche Bank AG. From 2004 to 2007, Mr. Klearman headed the marketing and structuring effort for rates-based structured products at BNP Paribas in New York. Mr. Klearman worked at AIG Financial Products from 1994 to 2004 trading rates-based volatility products as well as marketing and structuring. Mr. Klearman received his MBA in Finance from NYU Stern School of Business and his Bachelor of Science in Chemical Engineering from Purdue University.

Ryan Dofflemeyer has been portfolio manager at GraniteShares since September 2024. Mr. Dofflemeyer has over 20 years of experience working as a portfolio manager and trader for ETFs and mutual funds. Most recently, Mr. Dofflemeyer was a Senior Portfolio Manager for Vident Asset Management where he provided ETF sub-advisory services including fund management and trading across a variety of global equities and derivatives-based strategies. Prior to Vident Asset Management, Mr. Dofflemeyer was at ProShares ETFs from 2003 to 2020 where he headed the desks responsible for managing their leveraged and inverse global equities, commodities, and VIX futures ETFs. Mr. Dofflemeyer received his MBA from the University of Maryland Robert H. Smith School of Business and his Bachelor of Arts from the University of Virginia.

Jeroen Visser has been Portfolio Manager at GraniteShares since 2026. Mr. Visser has over 20 years of experience working as a financial professional, trading and structuring transactions in derivatives in Delta One and Securities Finance. Most recently, Mr. Visser was a Managing Director at Cantor Fitzgerald Prime Services. Prior to Cantor Fitzgerald, Mr. Visser traded reversals and conversion option strategies at ED&F Man Capital (now Marex) for 2 years and from 2007 until 2018 worked at ABN AMRO Bank in New York, where in his last role he managed the Alternative Balance Sheet Financing (Delta One) desk. Mr. Visser worked at Fortis Bank in Amsterdam from 1998 until 2007 as a trader in the Global Securities Lending and Arbitrage group. Mr. Visser has an MSc degree in International Finance and Accounting from the London School of Economics and an MSc degree in Econometrics from the University of Amsterdam.

The SAI provides additional information about the Portfolio Managers' compensation, other accounts managed, and ownership of Fund shares.

BUYING AND SELLING SHARES

The Funds issue and redeem shares at net asset value only in a large specified number of shares each called a "Creation Unit," or multiples thereof. A Creation Unit consists of 10,000 shares and is acquired by "Authorized Participants" which are market makers, broker dealers and/or large institutional investors that have entered into an agreement with ALPS Distributors, Inc., the distributor of each Fund's shares ("ADI" or the "Distributor"). Only Authorized Participants may acquire shares (aggregated in Creation Units) directly from a Fund, and only Authorized Participants may tender their shares for redemption directly to a Fund. Individual shares of the Fund may only be bought and sold in the secondary market through a broker-dealer at a market price. Fund shares are listed for secondary trading on the NASDAQ and can be bought and sold throughout the trading day like other publicly traded securities. The NASDAQ is generally open Monday through Friday and is closed weekends and the following holidays: New Year's Day, Martin Luther King, Jr. Day, Presidents' Day, Good Friday, Memorial Day, Juneteenth National Independence Day, Independence Day, Labor Day, Thanksgiving Day and Christmas Day.

The Fund may suspend the issuance of Creation Units only for a limited time and only due to extraordinary circumstances, such as when the markets on which the Fund's portfolio holdings are traded are closed for a limited period of time. If the Fund is unable to obtain sufficient exposure to the Underlying Leveraged ETF due to the limited availability of necessary investments or financial instruments, the Fund may, among other things, fail to meet its investment objective or incur increased transaction costs. If creations are suspended, or the Fund's ability to issue additional Creation Units is otherwise adversely affected, the Fund's shares could trade at a significant premium or discount to their net asset value, or the bid-ask spread of the Fund's shares could widen significantly, as the arbitrage mechanism that typically keeps secondary market prices in line with the Fund's NAV would be impaired. In the case of a period during which creations are suspended, the Fund could experience significant redemptions, which may cause the Fund to sell portfolio securities at unfavorable prices and incur increased transaction and other costs and make greater taxable distributions to shareholders of the Fund.

Because ETF shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (at a premium), at NAV or less than NAV (at a discount). Market prices of Fund shares may deviate significantly from the value of a Fund's underlying portfolio holdings (as reflected in the NAV per share) during periods of market stress, with the result that investors may pay significantly more or receive significantly less than the underlying value of the Fund shares bought or sold. It cannot be predicted whether Fund shares will trade below, at, or above their NAV. An investor may also incur costs attributable to the difference between the highest price a buyer is willing to pay to purchase shares of the Fund (bid) and the lowest price a seller is willing to accept for shares of the Fund (ask) when buying or selling shares in the secondary market (the "bid-ask spread"). In addition, when buying or selling shares through a broker, you will incur customary brokerage commissions and charges.

NAV per share for each Fund is computed by dividing the value of the net assets of the Fund (i.e., the value of its total assets less total liabilities) by its total number of shares outstanding. Expenses and fees, including management and distribution fees, if any, are accrued daily and taken into account for purposes of determining NAV. NAV is determined each business day, normally as of the close of regular trading of the NASDAQ (ordinarily 4:00 p.m., Eastern time).

When determining NAV, the value of a Fund's portfolio securities or other instruments is based on market prices of the securities or other instruments, which generally means a valuation obtained from an exchange or other market (or based on a price quotation or other equivalent indication of the value supplied by an exchange or other market) or a valuation obtained from an independent pricing service. If a security or other instrument's market price is not readily available or does not otherwise accurately reflect the fair value of the security or other instrument, the security or other instrument will be valued by another method that the Board believes will better reflect fair value in accordance with the Trust's valuation policies and procedures. Fair value pricing may be used in a variety of circumstances, including, but not limited to, situations when the value of a security or other instrument in a Fund's portfolio has been materially affected by events occurring after the close of the market on which the security or other instrument is principally traded but prior to the close of the NASDAQ (such as in the case of a corporate action or other news that may materially affect the price of a security) or trading in a security or other instrument has been suspended or halted. Accordingly, a Fund's NAV may reflect certain portfolio securities' fair values rather than their market prices.

Fair value pricing involves subjective judgments and it is possible that a fair value determination for a security or other instrument will materially differ from the value that could be realized upon the sale of the security or other instrument. This may result in a difference between the Fund's performance and the performance of the Underlying Leveraged ETF.

Book Entry

Shares of the Funds are held in book-entry form, which means that no stock certificates are issued. The Depository Trust Company ("DTC") or its nominee is the record owner of all outstanding shares of the Funds.

Investors owning shares of a Fund are beneficial owners as shown on the records of DTC or its participants. DTC serves as the securities depository for all shares of the Funds. Participants include DTC, securities brokers and dealers, banks, trust companies, clearing corporations, and other institutions that directly or indirectly maintain a custodial relationship with DTC. As a beneficial owner of shares, you are not entitled to receive physical delivery of stock certificates or to have shares registered in your name, and you are not considered a registered owner of shares. Therefore, to exercise any right as an owner of shares, you must rely upon the procedures of DTC and its participants. These procedures are the same as those that apply to any securities that you hold in book-entry or "street name" form. Your broker will provide you with account statements, confirmations of your purchases and sales, and tax information.

Frequent Redemptions and Purchases of Fund Shares

Unlike frequent trading of shares of a traditional open-end mutual fund's (i.e., not exchange-traded) shares, frequent trading of shares of a Fund on the secondary market does not disrupt portfolio management, increase the Fund's trading costs, lead to realization of capitalization gains, or otherwise harm the Fund's shareholders because these trades do not involve the Fund directly. Certain institutional investors are authorized to purchase and redeem each Fund's shares directly with the Fund. To the extent these trades are effected in-kind (i.e., for securities, and not for cash), they do not cause any of the harmful effects noted above that may result from frequent cash trades. Moreover, each Fund imposes transaction fees on in-kind purchases and redemptions of Creation Units to cover the custodial and other costs incurred by the Fund in effecting in-kind trades. These fees increase if an investor substitutes cash in part or in whole for Creation Units, reflecting the fact that the Fund's trading costs increase in those circumstances. For these reasons, the Board has determined that it is not necessary to adopt policies and procedures to detect and deter frequent trading and market-timing in shares of the Funds.

DIVIDENDS, DISTRIBUTIONS, AND TAXES

Fund Distributions

Dividends from net investment income, if any, are declared and paid at least annually by the Each Fund. Each Fund also intends to distribute net realized capital gains, if any, to its shareholders at least annually. Dividends and other distributions may be declared and paid more frequently to comply with the distribution requirements of Subchapter M of the Internal Revenue Code, and to avoid a federal excise tax imposed on RICs.

Dividend Reinvestment Service

Brokers may make available to their customers who own a Fund's shares the DTC book-entry dividend reinvestment service. If this service is available and used, dividend distributions of both income and capital gains will automatically be reinvested in additional whole shares of the Fund. Without this service, investors would receive their distributions in cash. In order to achieve the maximum total return on their investments, investors are encouraged to use the dividend reinvestment service. To determine whether the dividend reinvestment service is available and whether there is a commission or other charge for using this service, consult your broker. Brokers may require a Fund's shareholders to adhere to specific procedures and timetables. If this service is available and used, dividend distributions of both income and realized gains will be automatically reinvested in additional whole shares of the applicable Fund purchased in the secondary market.

Federal Income Tax Information

The following is a summary of some important U.S. federal income tax issues that affect each Fund and its shareholders. The summary is based on current U.S. federal income tax laws, which may be changed by legislative, judicial or administrative action. You should not consider this summary to be a detailed explanation of the tax treatment of a Fund, or the tax consequences of an investment in a Fund's shares. The summary is very general, and does not address investors subject to special rules, such as investors who hold shares through an IRA, a 401(k) or other tax-advantaged account. More information about U.S. federal income taxes is located in the SAI. You are urged to consult your tax advisor regarding specific questions as to federal, state and local income taxes.

Federal Income Tax Status of the Funds. Each Fund is treated as a separate entity for U.S. federal income tax purposes, and intends to qualify for the special tax treatment afforded to RICs under Subchapter M of the Internal Revenue Code. As long as a Fund qualifies as a RIC, it pays no U.S. federal income tax on the earnings it distributes to shareholders.

Federal Income Tax Status of Distributions:

- Each Fund will, for each year, distribute substantially all of its net investment income and net capital gains.
- Distributions reported by a Fund as "qualified dividend income" are generally taxed to noncorporate shareholders at rates applicable to long-term capital gains, provided certain holding period and other requirements are met. "Qualified dividend income" generally is income derived from dividends paid by U.S. corporations or certain foreign corporations that are either incorporated in a U.S. possession or eligible for tax benefits under certain U.S. income tax treaties. In addition, dividends that a Fund receives in respect of stock of certain foreign corporations may be qualified dividend income if that stock is readily tradable on an established U.S. securities market. Corporate shareholders may be entitled to a dividends-received deduction for the portion of dividends they receive that are attributable to dividends received by a Fund from U.S. corporations, subject to certain limitations.
- A Fund's strategies may limit its ability to distribute dividends eligible for qualified dividend income treatment for noncorporate shareholders and the dividends-received deduction for corporate shareholders.
- Any distributions of net capital gain (the excess of a Fund's net long-term capital gains over its net short-term capital losses) that you receive from a Fund are taxable as long-term capital gains regardless of how long you have owned your shares. Long-term capital gains are currently taxed to noncorporate shareholders at reduced maximum rates.
- If a Fund's distributions exceed its current and accumulated earnings and profits, the excess will be treated for federal income tax purposes as a tax-free return of capital to the extent of your basis in your shares and thereafter as a capital gain if you hold your shares as a capital asset. Because a return of capital distribution reduces the basis of your shares, a return of capital distribution may result in a higher capital gain or a lower capital loss when you sell your shares held in a taxable account.
- Taxable dividends and distributions are generally taxable to you whether you receive them in cash or in additional shares through a broker's dividend reinvestment service. If you receive dividends or distributions in the form of additional shares through a broker's dividend reinvestment service, you will be required to pay applicable federal, state or local taxes on the reinvested dividends but you will not receive a corresponding cash distribution with which to pay any applicable tax.

- A Fund may be able to pass through to you foreign tax credits for certain taxes paid by the Fund, provided the Fund meets certain requirements.

- Distributions paid in January but declared by a Fund in October, November or December of the previous year to shareholders of record in one of those months may be taxable to you in the previous year.

- A Fund will inform you of the amount of your ordinary income dividends, qualified dividend income, return of capital, foreign tax credits and net capital gain distributions received from the Fund shortly after the close of each calendar year.

Taxes on Exchange-Listed Share Sales. Any capital gain or loss realized upon a sale of shares will generally be treated as long-term capital gain or loss if the shares have been held for more than one year and as short-term capital gain or loss if the shares have been held for one year or less, except that any capital loss on the sale of shares held for six months or less will be treated as long-term capital loss to the extent of amounts treated as distributions of net capital gain to the shareholder with respect to such shares.

Medicare Tax. U.S. individuals with income exceeding $200,000 ($250,000 if married and filing jointly) are subject to a 3.8% Medicare contribution tax on their "net investment income," including interest, dividends, and capital gains (including capital gains realized on the sale or exchange of shares). This 3.8% tax also applies to all or a portion of the undistributed net investment income of certain shareholders that are estates and trusts.

Non-U.S. Investors. If you are not a citizen or permanent resident of the United States, a Fund's ordinary income dividends will generally be subject to a 30% U.S. withholding tax, unless a lower treaty rate applies or unless such income is effectively connected with a U.S. trade or business. This 30% withholding tax generally will not apply to distributions of net capital gain.

Distributions, sale proceeds and certain capital gain dividends paid to a shareholder that is a "foreign financial institution" as defined in Section 1471 of the Internal Revenue Code and that does not meet the requirements imposed on foreign financial institutions by Section 1471 will generally be subject to withholding tax at a 30% rate. Distributions, sale proceeds and certain capital gain dividends paid to a non-U.S. shareholder that is not a foreign financial institution will generally be subject to such withholding tax if the shareholder fails to make certain required certifications. Recently issued proposed Treasury Regulations, however, generally eliminate such withholding on gross proceeds, which include certain capital gains distributions and sale proceeds from a sale or disposition of Fund shares. Taxpayers generally may rely on these proposed Treasury Regulations until final Treasury Regulations are issued. A non-U.S. shareholder may be exempt from the withholding described in this paragraph under an applicable intergovernmental agreement between the U.S. and a foreign government, provided that the shareholder and the applicable foreign government comply with the terms of such agreement.

Backup Withholding. A Fund or your broker will be required in certain cases to withhold (as "backup withholding") on amounts payable to any shareholder who (1) has provided either an incorrect taxpayer identification number or no number at all, (2) is subject to backup withholding by the Internal Revenue Service for failure to properly report payments of interest or dividends, (3) has failed to certify that such shareholder is not subject to backup withholding, or (4) has not certified that such shareholder is a U.S. person (including a U.S. resident alien). The backup withholding rate is currently 24%. Backup withholding will not, however, be applied to payments that have been subject to the 30% withholding tax applicable to shareholders who are neither citizens nor residents of the United States.

Taxes on Purchases and Redemptions of Creation Units. An authorized purchaser having the U.S. dollar as its functional currency for U.S. federal income tax purposes who exchanges securities for Creation Units generally recognizes a gain or a loss. The gain or loss will be equal to the difference between the value of the Creation Units at the time of the exchange and the exchanging authorized purchaser's aggregate basis in the securities delivered, plus the amount of any cash paid for the Creation Units. An authorized purchaser who exchanges Creation Units for securities will generally recognize a gain or loss equal to the difference between the exchanging authorized purchaser's basis in the Creation Units and the aggregate U.S. dollar market value of the securities received, plus any cash received for such Creation Units. The Internal Revenue Service may assert, however, that an authorized purchaser who does not mark-to-market its holdings may not be permitted to currently deduct losses upon an exchange of securities for Creation Units under the rules governing "wash sales," or on the basis that there has been no significant change in economic position. Persons exchanging securities should consult their own tax advisor with respect to whether wash sale rules apply and when a loss might be deductible.

Any capital gain or loss realized upon redemption of Creation Units is generally treated as long-term capital gain or loss if the shares have been held for more than one year and as a short-term capital gain or loss if the shares have been held for one year or less.

A Fund may include a payment of cash in addition to, or in place of, the delivery of a basket of securities upon the redemption of Creation Units. A Fund may sell portfolio securities to obtain the cash needed to distribute redemption proceeds. This may cause a Fund to recognize investment income and/or capital gains or losses that it might not have recognized if it had completely satisfied the redemption in-kind. As a result, a Fund may be less tax efficient if it includes such a cash payment in the proceeds paid upon the redemption of Creation Units.

The foregoing discussion summarizes some of the possible consequences under current federal income tax law of an investment in a Fund. It is not a substitute for personal tax advice. You also may be subject to state, local and foreign tax on Fund distributions and sales of shares. Consult your personal tax advisor about the potential tax consequences of an investment in shares under all applicable tax laws. For more information, please see the section entitled "Federal Income Taxes" in the SAI.

DISTRIBUTION OF FUND SHARES

ALPS Distributors, Inc. (the "Distributor") is a broker-dealer registered with the U.S. Securities and Exchange Commission. The Distributor distributes Creation Units for the Funds on an agency basis and does not maintain a secondary market in Fund shares. The Distributor has no role in determining the policies of the Funds or the securities that are purchased or sold by a Fund. The Distributor's principal address is 1290 Broadway, Suite 1000, Denver, CO 80203.

The Board has adopted a Distribution and Service Plan (the "Plan") pursuant to Rule 12b-1 under the 1940 Act. In accordance with the Plan, each Fund is authorized to pay an amount up to 0.25% of its average daily net assets each year for certain distribution-related activities and shareholder services. No Rule 12b-1 fees are currently paid by a Fund, and there are no plans to impose these fees. However, in the event Rule 12b-1 fees are charged in the future, because the fees are paid out of the applicable Fund's assets, over time these fees will increase the cost of your investment and may cost you more than certain other types of sales charges.

PREMIUM/DISCOUNT INFORMATION

Information on the daily NAV per share of each Fund can be found at www.graniteshares.com. Additionally, information regarding how often the shares of each Fund traded on the Exchange at a price above (i.e., at a premium) or below (i.e., at a discount) the NAV of the Fund is available at www.graniteshares.com. Any such information represents past performance and cannot be used to predict future results.

FUND SERVICE PROVIDERS

Brown Brothers Harriman & Co. ("BBH") is the custodian and transfer agent for the Funds. BBH is located at 50 Post Office Square, Boston, MA 02110-1548.

ALPS Fund Services, Inc., located at 1290 Broadway, Suite 1000, Denver, CO 80203, is the administrator for the Funds.

ALPS Distributors, Inc., located at 1290 Broadway, Suite 1000, Denver, CO 80203, is the distributor for the Funds.

Tait Weller & Baker LLP, located at 50 South 16th Street, Suite 2900, Philadelphia, PA 19102, serves as the Funds' independent registered public accounting firm. Tait Weller & Baker LLP has been appointed by the Board to audit the annual financial statements of the Funds.

FINANCIAL HIGHLIGHTS

For a Share Outstanding Throughout the Periods Presented

	For the Period May 4, 2026 (Commencement of Operations) to June 30, 2026
NET ASSET VALUE, BEGINNING OF PERIOD	$ 25.00
INCOME FROM OPERATIONS:	
Net investment income[a]	0.06
Net realized and unrealized loss	(0.41)
Total from investment operations	(0.35)
DISTRIBUTIONS:	
From net investment income	(0.05)
From return of capital	(0.19)
Total distributions	(0.24)
NET (DECREASE) IN NET ASSET VALUE	(0.59)
NET ASSET VALUE, END OF PERIOD	$ 24.41
TOTAL RETURN[b]	(1.39)%
RATIOS/SUPPLEMENTAL DATA:	
Net assets, end of period (in 000s)	$ 732
RATIOS TO AVERAGE NET ASSETS	
Ratio of expenses to average net assets	14.42%[c]
Ratio of expenses including waiver/reimbursement to average net assets	1.15%[c]
Ratio of net investment income to average net assets	1.49%[c]
Portfolio turnover rate	0%

(a) Based on daily average shares outstanding during the period.
(b) Total return is calculated assuming an initial investment made at the net asset value at the beginning of the period and redemption at the net asset value on the last day of the period and assuming all distributions are reinvested at the reinvestment prices (lower of market or NAV on ex-date).
(c) Annualized.

For a Share Outstanding Throughout the Periods Presented

	For the Period September 15, 2025 (Commencement of Operations) to June 30, 2026
NET ASSET VALUE, BEGINNING OF PERIOD	$ 25.00
INCOME FROM OPERATIONS:	
Net investment income(a)	0.32
Net realized and unrealized gain	5.05
Total from investment operations	5.37
DISTRIBUTIONS:	
From net investment income	(3.17)
From return of capital	(11.36)
Total distributions	(14.53)
NET (DECREASE) IN NET ASSET VALUE	(9.16)
NET ASSET VALUE, END OF PERIOD	$ 15.84
TOTAL RETURN[b]	30.99%
RATIOS/SUPPLEMENTAL DATA:	
Net assets, end of period (in 000s)	$ 9,185
RATIOS TO AVERAGE NET ASSETS	
Ratio of expenses to average net assets	1.51%[c]
Ratio of expenses including waiver/reimbursement to average net assets	1.15%[c]
Ratio of net investment income to average net assets	2.12%[c]
Portfolio turnover rate	0%

(a) Based on daily average shares outstanding during the period.
(b) Total return is calculated assuming an initial investment made at the net asset value at the beginning of the period and redemption at the net asset value on the last day of the period and assuming all distributions are reinvested at the reinvestment prices (lower of market or NAV on ex-date).
(c) Annualized.
